# Clinical Immunogenicity

## Case Studies in the Life Cycle of ADA Assays

Kyra Cowan

March 24, 2020

**MERCK**

# 0 Introduction

# Key Points

**What you can count on:**

**Change.**

**What you can't count on:**

**What exactly those changes will be.**

- Colleagues
- Institutional expertise, strategies
- External partnerships (Pharma to CRO and vice-versa)
- Health authority recommendations
- Methodologies

# Story Summary

## Changes can occur in ADA assays over time for long term, multi-site clinical trials:

- **Cut point**
  - Sample basis for establishment of cut point
  - In-study cut points for different disease states and studies in different populations
- **Change/addition of laboratories at CROs, or could be transferring in-house to CRO**
  - Additional Capacity
  - Lab Closures
  - China - samples need to be run in-country
- **Change of assay format**
  - Difficulties in validation of assay at second lab
  - Detection of different positives
  - New technologies
- **Take-home lessons**

Clinical Immunogenicity: Case Studies in the Life Cycle of ADA Assays - March 24, 2021

1 Using Correct ADA  
Screening cut point factor

## For example: Calculating a cut point

- Evaluate distribution of naïve samples
- Eliminate outliers
- Calculate a 95% confidence interval for a 5% false positive rate

Often performed for normal healthy (black diamonds) plus another, disease population (white circle) and if no meaningful difference, keep using normal healthy cut point factor for convenience

For the example on the left, the normal healthy sera were from the validation and the disease population was baseline samples from full clinical development of a rare indication.

## Case Study 1 – Original Cut Point False Positive Rate <2%

**Normal Human Serum** cut point established-during initial validation and used for clinical trial sample analysis:

| <b>Trial</b> | <b>Samples</b> | <b>% Positive</b> | <b>% False Positive</b> |
|--------------|----------------|-------------------|-------------------------|
| <b>1</b>     | <b>299</b>     | <b>0</b>          | <b>0</b>                |
| <b>2</b>     | <b>9471</b>    | <b>1.3</b>        | <b>0.3</b>              |

False Positive Rate (FPR) <2%

## Case Study 1 –

Cut point re-established using study (disease specific) baseline samples

| <b>Trial</b> | <b>Samples</b> | <b>% Positive</b> | <b>% False Positive</b> |
|--------------|----------------|-------------------|-------------------------|
| <b>1</b>     | <b>301</b>     | <b>2.0</b>        | <b>7.4</b>              |
| <b>2</b>     | <b>9471</b>    | <b>1.8</b>        | <b>5.8</b>              |

Lower cut point resulting in FPR between 2-11%

Result in overall percent positive subjects across 3 trials in ~2% increase in incidence of treatment-emergent immunogenicity.

Correct material from study – population serum

## Case Study 2 – Original Cut Point False Positive Rate >11%

**Commercial disease state sera** used for initial validation cut point of  $\sim 1.06$ .

Several clinical studies had false positive rates significantly in excess of 11%

## Case Study 2 – Study-Specific Cut Points

Cut points re-established using study baseline samples:

| <b>Trial</b> | <b>Samples</b> | <b>% Positive</b> | <b>% False Positive</b> |
|--------------|----------------|-------------------|-------------------------|
| <b>1</b>     | <b>3206</b>    | <b>10.3</b>       | <b>5.0</b>              |
| <b>2</b>     | <b>9471</b>    | <b>10.2</b>       | <b>6.9</b>              |
| <b>3</b>     | <b>661</b>     | <b>13.8</b>       | <b>8.8</b>              |

Study specific cut point results in FPR between 2-11%

At least look at the study samples

# Cutpoint Take Home

**Assay validation with commercially available samples may not accurately emulate study samples.**

Many factors can affect cut-point:

Disease state

Population/race

Population/age

**Test pre-dose samples from clinic.**

Can assess FPR and adjust accordingly:

Viswanath Devanarayan, et. al., *Recommendations for Systematic Statistical Computation of Immunogenicity Cut Points*, AAPS Journal, Vol. 19:1487.

1. If false positive rate between 2% to 11% use pre-study validation SCP and CCP
2. If FPR is less than 2% or greater than 11%, new study-specific SCP and CCP should be determined using clinical study baseline samples.

## 2 Changing Anti-Drug Antibody Assay

# Changes in ADA Assay

## 1. Lab 1 – Original ADA assay

### 1. Stepwise ECL Bridging

## 2. Lab 2 -

1. Concerns about Lab 1 capacity for phase 3 trial testing
2. Attempt to transfer assay to Lab 2 – stepwise assay did not transfer well
3. Modified homogeneous ECL bridging assay developed and validated
4. Lab 1 announced shut down of lab

*“Frank! Is it wise to change your horse mid-stream?”*

## Lab 1 Assay vs Lab 2 Assay Comparison

| Parameter                        | Lab 1                                   | Lab 2   |
|----------------------------------|---|---|
| <b>Matrix</b>                    | Serum                                   | Serum   |
| <b>Analysis Method</b>           | ECL - Stepwise                          | ECL - Homogenous  |
| <b>Screening Cutpoint Factor</b> | 1.25                                    | 1.12  |
| <b>Confirmation Cutpoint</b>     | 49.5%                                   | 22.5%   |
| <b>Sensitivity (ng/mL)</b>       | 5.12                                    | 10.0  |
| <b>Drug Tolerance</b>            | 250ng/ml PC can tolerate up to 125ug/ml | 250 ng/mL PC can tolerate up to 100 µg/mL               |
| <b>MRD</b>                       | 1 (60)*                                 | 60  |
| <b>Titer</b>                     | (2-fold) 1, 2, 4, 8, 16, 32, 64, 128    | (3-fold) 60, 180, 540, 1620, 4860, 14580, 43740, 131220 |

\*Before draft guidance – MRD should include all dilutions

(60): Lab used „1“ for MRD but in reality it should have been 60 if done correctly

## Case 1 - Data Comparison for Positive Samples Lab 1/2

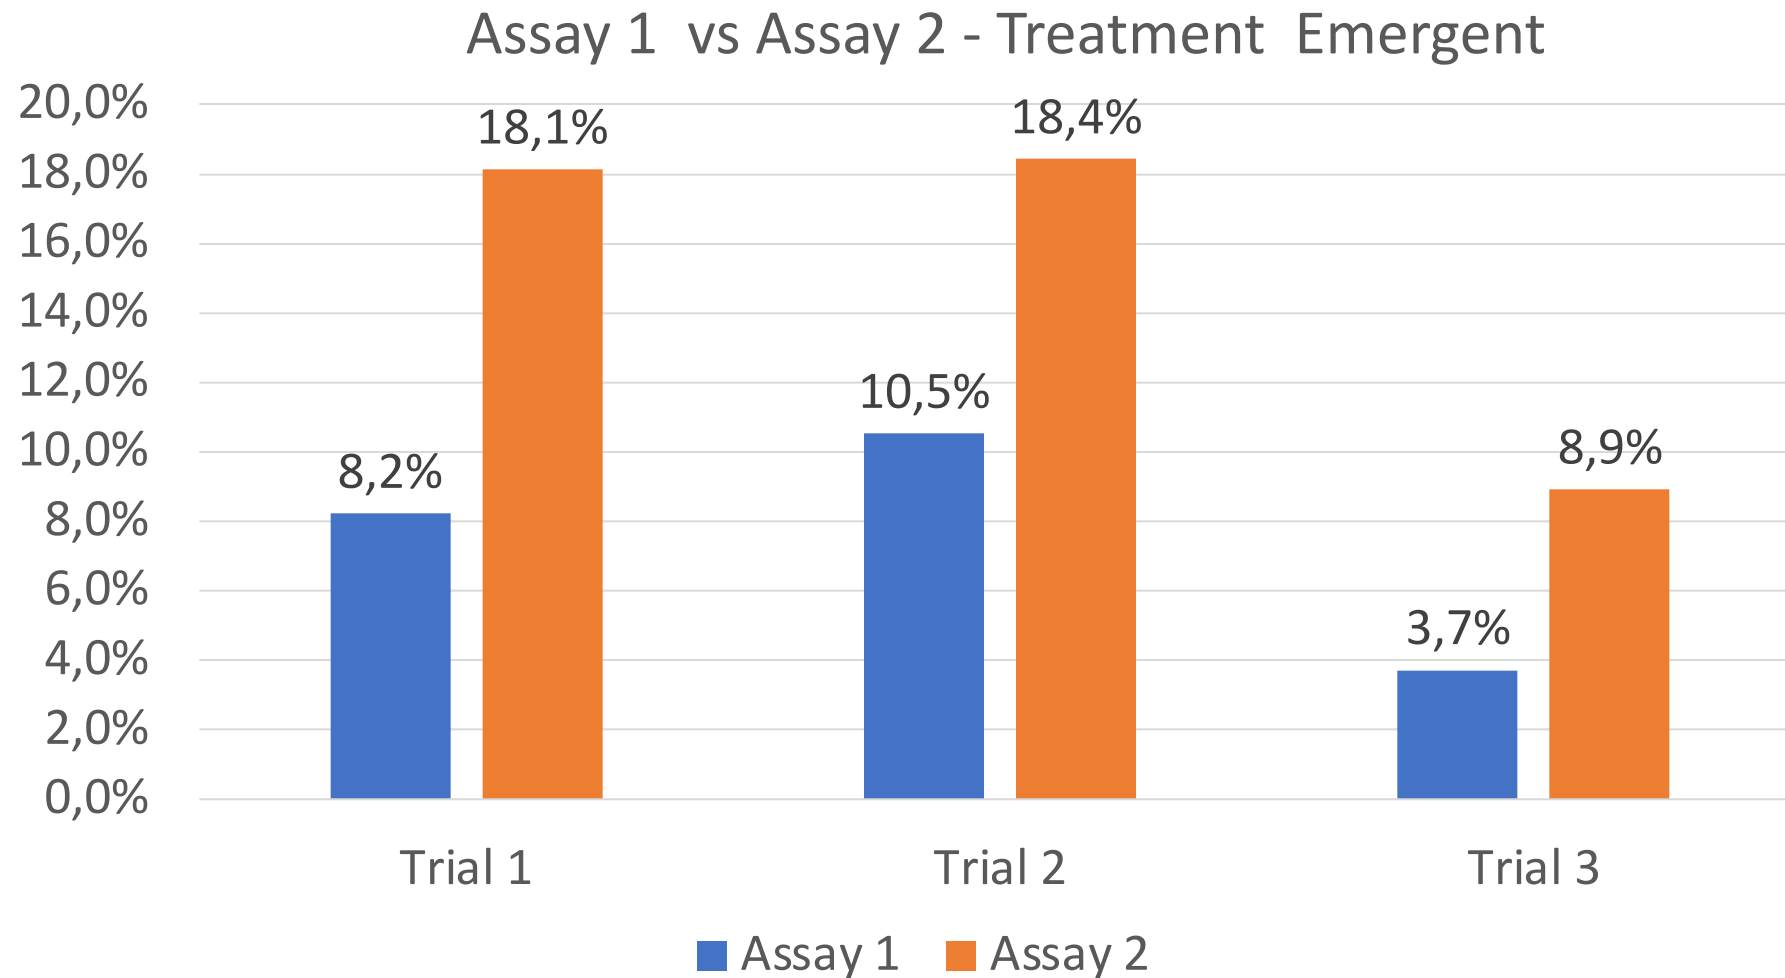

|                       | Lab 1 - Stepwise |             |             | Lab 2 - Homogeneous |             |             |
|-----------------------|------------------|-------------|-------------|---------------------|-------------|-------------|
| Sample                | SCREEN           | CONFIRM     | TITER       | SCREEN              | CONFIRM     | TITER       |
| 1                     | Negative         | n.a         | n.a         | Positive            | Positive    | 180         |
| 2                     | Negative         | n.a         | n.a         | Positive            | Positive    | 180         |
| 3                     | Negative         | n.a         | n.a.        | Positive            | Positive    | 60          |
| 4                     | Positive         | Negative    | n.a.        | Positive            | Positive    | 180         |
| 5                     | Positive         | Negative    | n.a.        | Positive            | Positive    | 540         |
| 6                     | Positive         | Negative    | n.a.        | Positive            | Positive    | 540         |
| 7                     | Positive         | Positive    | 2           | Positive            | Positive    | 180         |
| 8                     | Positive         | Positive    | 4           | Positive            | Positive    | 540         |
| 9                     | Positive         | Positive    | 8           | Positive            | Positive    | 1620        |
| 10                    | Positive         | Positive    | 8           | Positive            | Positive    | 1620        |
| 11                    | Positive         | Positive    | 8           | Positive            | Positive    | 43740       |
| 12                    | Positive         | Positive    | 32          | Positive            | Positive    | 14580       |
|                       |                  |             |             |                     |             |             |
| <b>False Positive</b> | <b>3.0%</b>      | <b>2.0%</b> | <b>1.0%</b> | <b>12.3%</b>        | <b>4.0%</b> | <b>8.3%</b> |

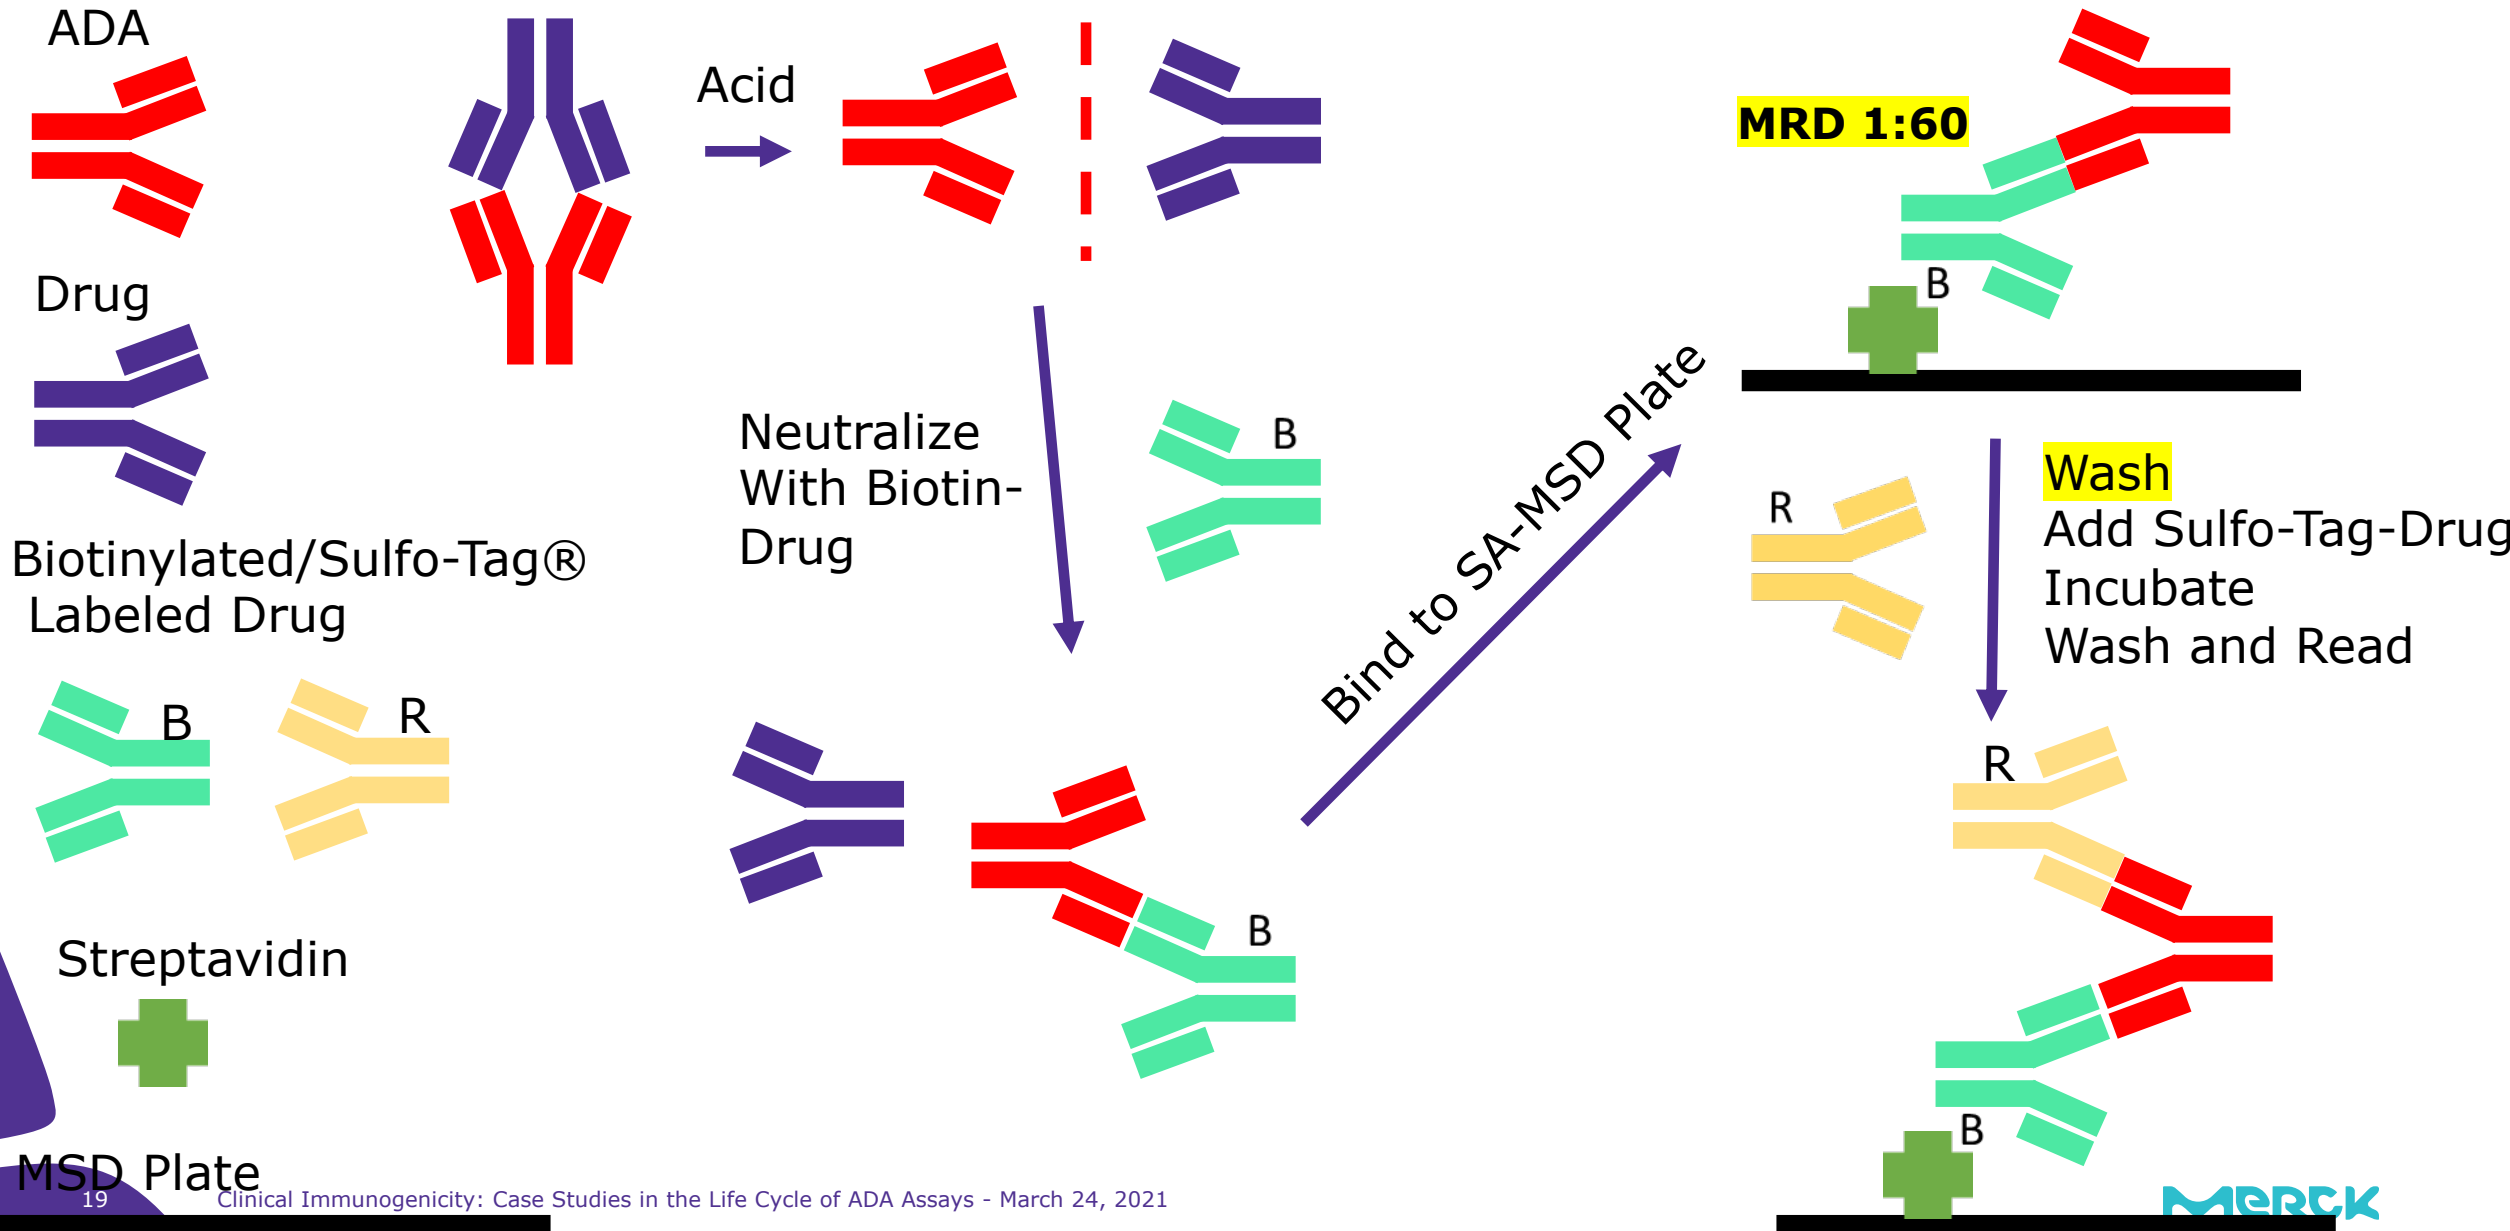

## Case 2 - Data Comparison for Positive Samples Lab 1/2

| Sample                | Lab 1 - Stepwise |             |             | Lab 2 - Homogeneous |             |             |
|-----------------------|------------------|-------------|-------------|---------------------|-------------|-------------|
|                       | Screen           | Confirm     | Titer       | Screen              | Confirm     | TITER       |
| 1                     | Negative         | n.a         | n.a         | Positive            | Positive    | 60          |
| 2                     | Negative         | n.a         | n.a         | Positive            | Positive    | 60          |
| 3                     | Negative         | n.a         | n.a         | Positive            | Positive    | 60          |
| 4                     | Negative         | n.a         | n.a         | Positive            | Positive    | 60          |
| 5                     | Negative         | n.a         | n.a         | Positive            | Positive    | 180         |
| 6                     | Negative         | n.a         | n.a         | Positive            | Positive    | 1620        |
| 7                     | Negative         | n.a         | n.a         | Positive            | Positive    | 1620        |

| 9                     | Positive         | Negative    | n.a         | Positive            | Positive    | 180         |
| 10                    | Positive         | Negative    | n.a         | Positive            | Positive    | 540         |
| 11                    | Positive         | Positive    | 1           | Positive            | Positive    | 60          |
| 12                    | Positive         | Positive    | 4           | Positive            | Positive    | 540         |
| 13                    | Positive         | Positive    | 4           | Positive            | Positive    | 1620        |
| 14                    | Positive         | Positive    | 16          | Positive            | Positive    | 1620        |
| 15                    | Positive         | Positive    | 8           | Positive            | Positive    | 1620        |
| 16                    | Positive         | Positive    | 8           | Positive            | Positive    | 1620        |
| 17                    | Positive         | Positive    | 64          | Positive            | Positive    | 4860        |
| 18                    | Positive         | Positive    | 8           | Positive            | Positive    | 4860        |
| 19                    | Positive         | Positive    | 16          | Positive            | Positive    | 4860        |
| 20                    | Positive         | Positive    | 4           | Positive            | Positive    | 14580       |
| <b>False Positive</b> | <b>6.2%</b>      | <b>1.4%</b> | <b>4.8%</b> | <b>7.8%</b>         | <b>2.8%</b> | <b>4.9%</b> |

# ADA Patient Positives Across Multiple Studies

# ADA Lab 1 – Step-Wise Electrochemiluminescence Format

# ADA Lab 2 – Homogeneous Electrochemiluminescence Format

# Assay Format Changes

- Lab changes happen (for a variety of reasons) and are not necessarily avoidable
- Transferring assays between labs does not always go smoothly
- To address this...
  - Clear communication in 2.7, integrated summary of immunogenicity (ISI)
  - Case-by-case basis with health authorities

# 3 Neutralizing Antibody Assay

# Competitive Ligand Binding NAb assay

First generation neutralizing ADA assay had poor drug tolerance

# First Generation Neutralizing Antibody Competitive Ligand Binding ECL Assay

Drug Coated MSD Plate

|                       | Old nAb Assay                        |
|-----------------------|--------------------------------------|
| <b>Cut point</b>      | 0.710                                |
| <b>Sensitivity</b>    | 297ng/mL                             |
| <b>Drug Tolerance</b> | 297 ng/mL PC up to <b>31.3 ng/mL</b> |

**C<sub>trough</sub> levels are 20-50 ug/mL**

## Concern over poor drug tolerance

- By us, by HAs
- nAb antibodies detected multiple clinical trials at drug levels well in excess of drug tolerance of assay including at multiple c-trough time points
- the pAb PC in this assay may have underestimated the drug tolerance of treatment-emergent nAbs

# nAb Assay History

## 1. Original NAb Assay

1. Poor drug tolerance
2. Few positive samples

## 2. New NAb Assay

1. Modified assay format
2. New monoclonal PC
3. More sensitive
4. Better drug tolerance
5. Significantly higher % positives

# Second Generation Neutralizing Antibody Competitive Ligand Binding ECL Assay

SulfoTag Strepavidin

Drug Coated MSD Plate

|                       | Old nAb Assay      | New nAb Assay         |
|-----------------------|--------------------|-----------------------|
| <b>Cut point</b>      | 0.710              | 0.919                 |
| <b>Sensitivity</b>    | 297ng/mL           | 39.7ng/mL             |
| <b>Drug Tolerance</b> | 297 ng/mL PC up to | 39.7ng/mL PC at least |
|                       | <b>31.3 ng/mL</b>  | <b>100ug/mL</b>       |

## Case 1 - Comparison Old vs New Assay nAb Data 38 ADA Positive Samples

| <b>Old/New</b> | <b>Number</b> | <b>% ADA Pos Samples</b> | <b>GeoMean Titer</b> |
|----------------|---------------|--------------------------|----------------------|
| Neg/Neg        | 8             | 21.1%                    | 69                   |
| <b>Neg/Pos</b> | <b>24</b>     | <b>63.2%</b>             | <b>1289</b>          |
| <b>Pos/Neg</b> | <b>0</b>      | <b>0.0%</b>              |                      |
| Pos/Pos        | 6             | 15.8%                    | 1946                 |

## Case 2 - Comparison Old vs New Assay nAb Data 200 ADA Positive Samples

| <b>Old/New</b> | <b>Number</b> | <b>% ADA Pos Samples</b> | <b>GeoMean Titer</b> |
|----------------|---------------|--------------------------|----------------------|
| Neg/Neg        | 65            | 32.5                     | 177                  |
| <b>Neg/Pos</b> | <b>99</b>     | <b>49.5</b>              | <b>951</b>           |
| Pos/Neg        | 7             | 3.5                      | 288                  |
| Pos/Pos        | 29            | 14.5                     | 3872                 |

## nAb Assay

New more drug tolerant assay detects significantly more NAb positive samples

What did we do to address this...

- Detecting more Nab positive samples, but no clinical sequelae correlated to this
- Case-by-case basis.

# 4 Take Home

# Take Home Lessons

## **Changes in can occur in ADA assays over time for long term, multi-site clinical trials**

Changes can occur for a lot of reasons:

New technologies, regulations, white papers, changing perceptions, changing labs...

So:

Think long-term as much as possible.

How does this help the clinician, the patient?

5 Thank you!

Kudos:  
Jim Bourdage (B2S)
