

HEMATOCRIT PREDICTION OF DRIED BLOOD

SPOTS: CURRENT STATUS AND FUTURE OUTLOOK

Liesl Heughebaert, Lisa Delahaye, Christoph Lühr, Stijn Lambrecht and Christophe Stove

14th EBF symposium – 25/11/2021

PRESENTATION OUTLINE

- Current status:
 - Dried blood spots and the hematocrit effect
 - Strategies to cope with the hematocrit effect
- Near-infrared-based hematocrit prediction of DBS: an in-depth evaluation
 - Extensive evaluation of a commercially available NIR set-up:
 - Performance of the calibration model
 - Method validation and stability
 - Robustness
 - Method comparison and application
- Future outlook: where are we heading?

NIR-BASED PREDICTION OF THE HEMATOCRIT: OBJECTIVES

1. Performance of the initial calibration model

2. Method validation

3. Robustness

4. Method comparison and application

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Original calibration model

Upon evaluation of an initial calibration model, two issues were seen:

1. An unacceptable negative bias
2. A time-dependent bias

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Original calibration model

Upon evaluation of an initial calibration model, two issues were seen:

1. An unacceptable negative bias: tackled by adding the spectra of 150 (duplicate) DBS
2. A time-dependent bias

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Original calibration model

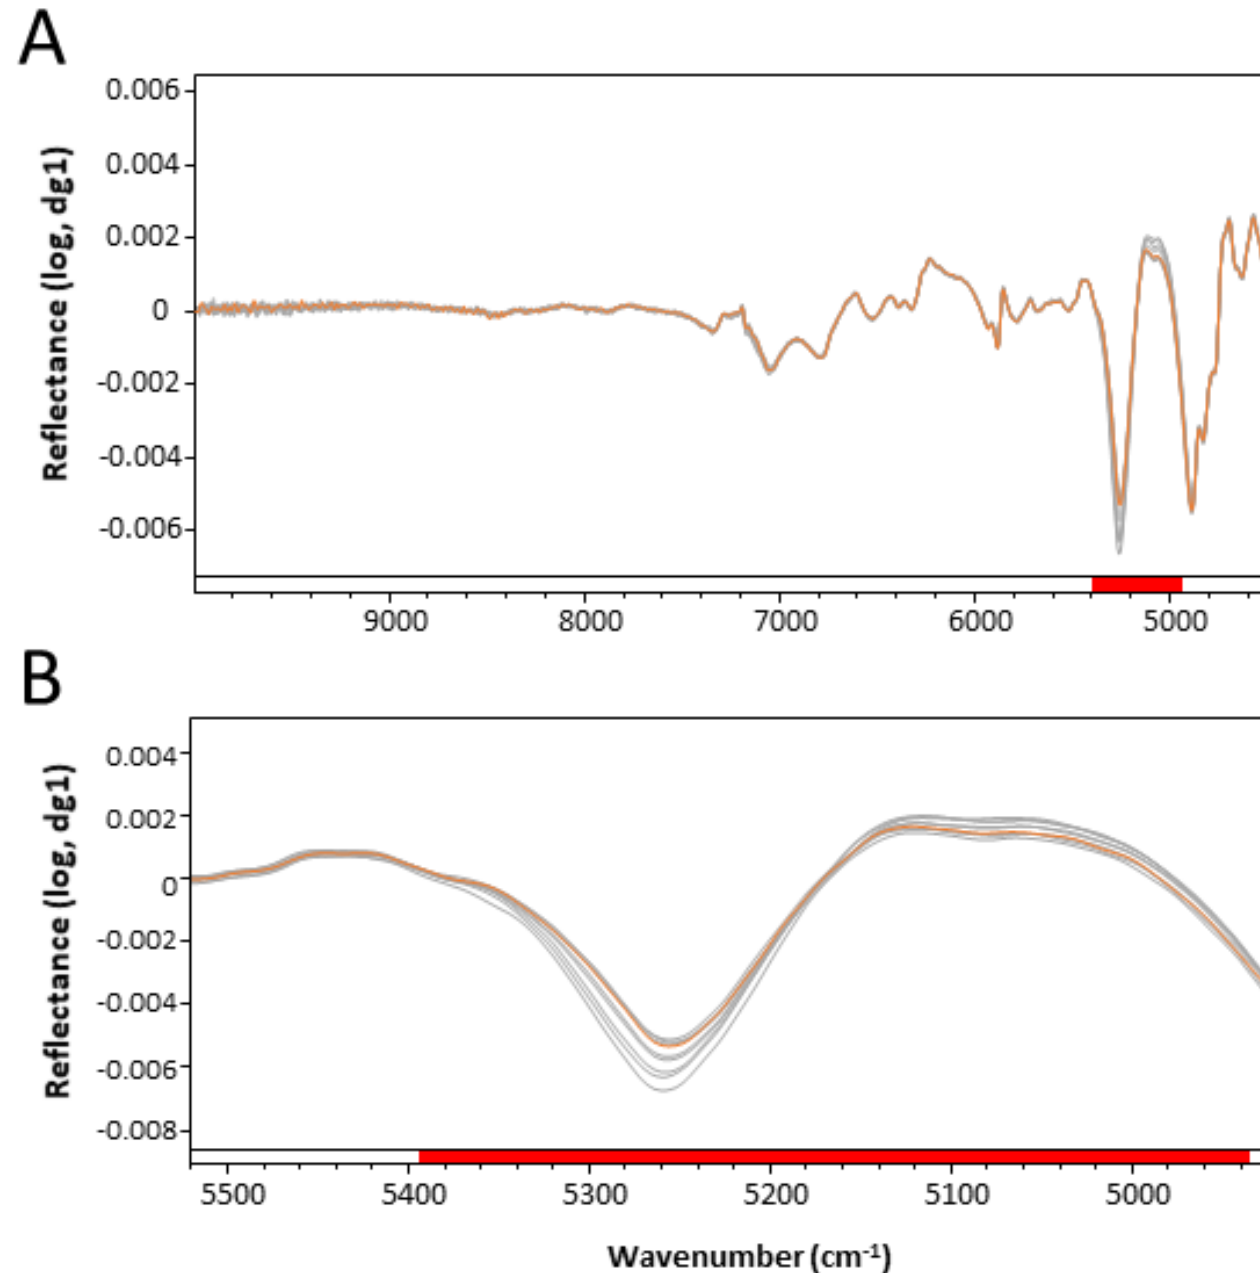

Update with data from 150 patient samples

Upon evaluation of an initial calibration model, two issues were seen:

1. An unacceptable negative bias: tackled by adding the spectra of 150 (duplicate) DBS
2. A time-dependent bias

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Upon evaluation of an initial calibration model, two issues were seen:

1. An unacceptable negative bias: tackled by adding the spectra of 150 (duplicate) DBS
2. A time-dependent bias: tackled by excluding the wavenumber range 5380-4968 cm⁻¹

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Original calibration model

Update with data from 150 patient samples

Exclusion of wavenumber range 5380-4968 cm⁻¹

1. Performance of the calibration model	2. Method validation	3. Robustness	4. Method comparison	5. Method application
---	----------------------	---------------	----------------------	-----------------------

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Method validation

- Accuracy: maximum bias of 0.012 L/L
- Precision: maximum total imprecision of 4.5 %

Hct range	Number of samples	Intra-day precision (CV, %)	Total precision (CV, %)	Bias	
				%	L/L
<0.20	3	4.5	4.5	4.2	0.008
0.20-0.25	7	4.4	4.4	5.4	0.012
0.25-0.30	7	3.5	3.5	1.4	0.004
0.30-0.35	7	3.5	3.5	1.8	0.006
0.35-0.40	7	4.2	4.2	0.8	0.003
0.40-0.45	7	1.9	2.6	0.7	0.003
0.45-0.50	7	2.8	2.8	-2.8	-0.013
>0.50	4	3.0	3.0	-0.8	-0.005

Stability

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

‘A good result can only be collected from a correctly collected sample.’

No inter-operator variability.

No relevant effect of measurement location or type of filter paper.

No relevant effect of the volume spotted except for 10 μ L spots.

NIR-based Hct prediction proved to be very robust.

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Method comparison

- Conventional Hct measurement (via a hematology analyzer) vs. NIR-based Hct prediction

→ Difference between NIR and reference method within ± 0.05 L/L

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Method application

- Application of the method on capillary DBS (n=36)
 - NIR-based Hct vs Hct measured with a Hct centrifuge

Underestimation?

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Method application

- Application of the method on capillary DBS (n=36)
 - NIR-based Hct vs Hct measured with a Hct centrifuge:
underestimation of the Hct of -0.043 L/L
- What is the difference between capillary and venous patient samples?

The presence of an anticoagulant

NEAR-INFRARED-BASED PREDICTION OF THE HEMATOCRIT

Method application

- Application of the method on capillary DBS (n=36)
 - NIR-based Hct vs Hct measured with a Hct centrifuge **after correction**

— Mean - - - - Limit of agreement - - Trend line — Acceptance limit

CONCLUSION

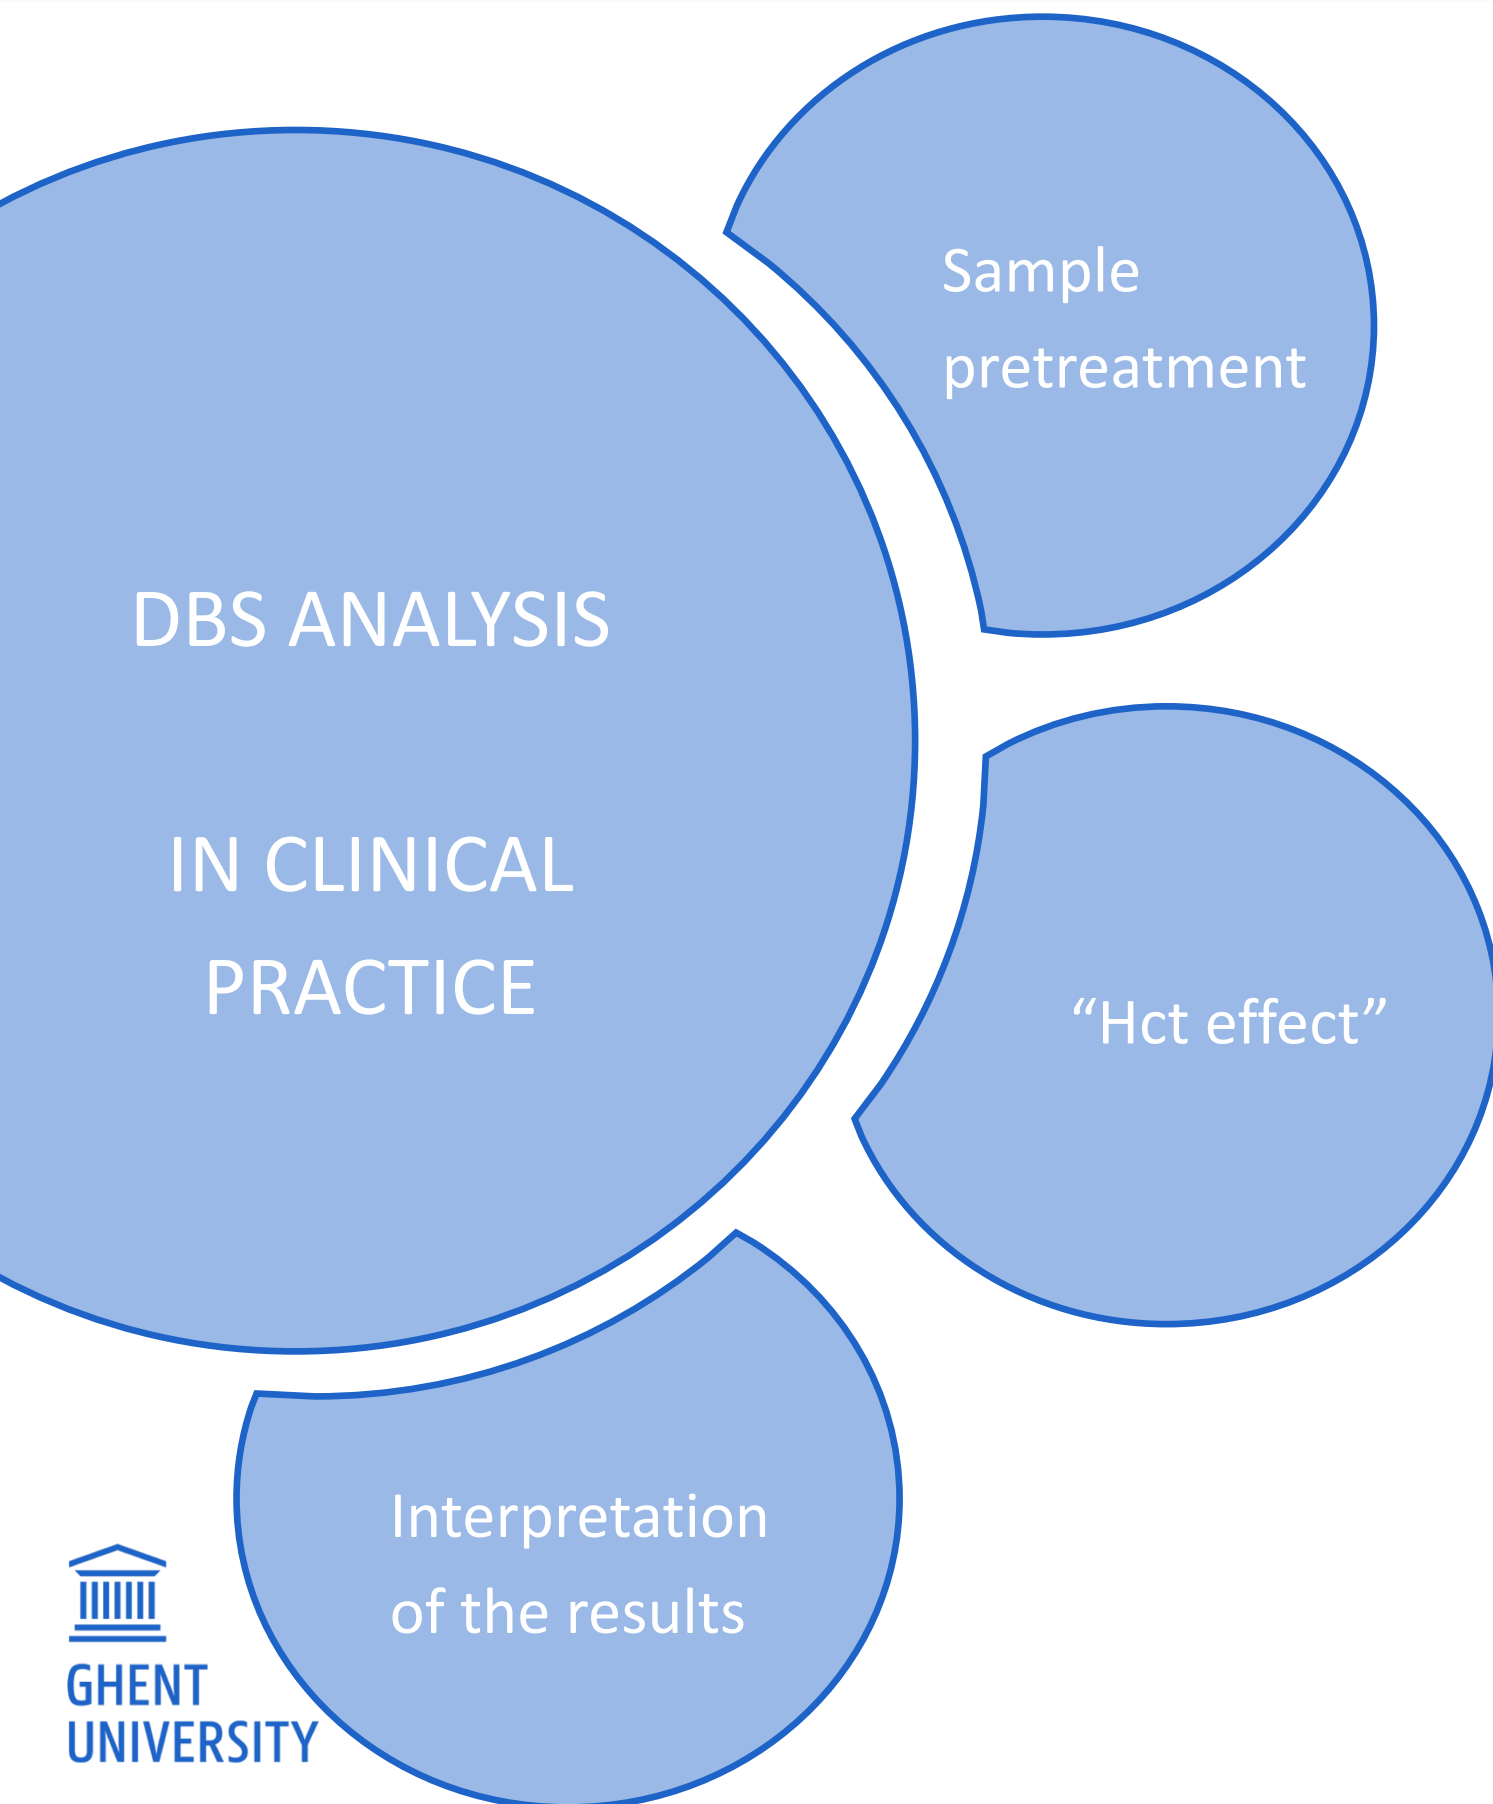

NIR – based Hct prediction is:

- Accurate and precise
- Hct can still be predicted after 1 month of storage of the DBS at RT or lower
- Robust
- Applicable on capillary samples, however the predicted Hct is currently underestimated (-0.043 L/L)
 - This may be corrected for by an arbitrary correction factor - future research needed.

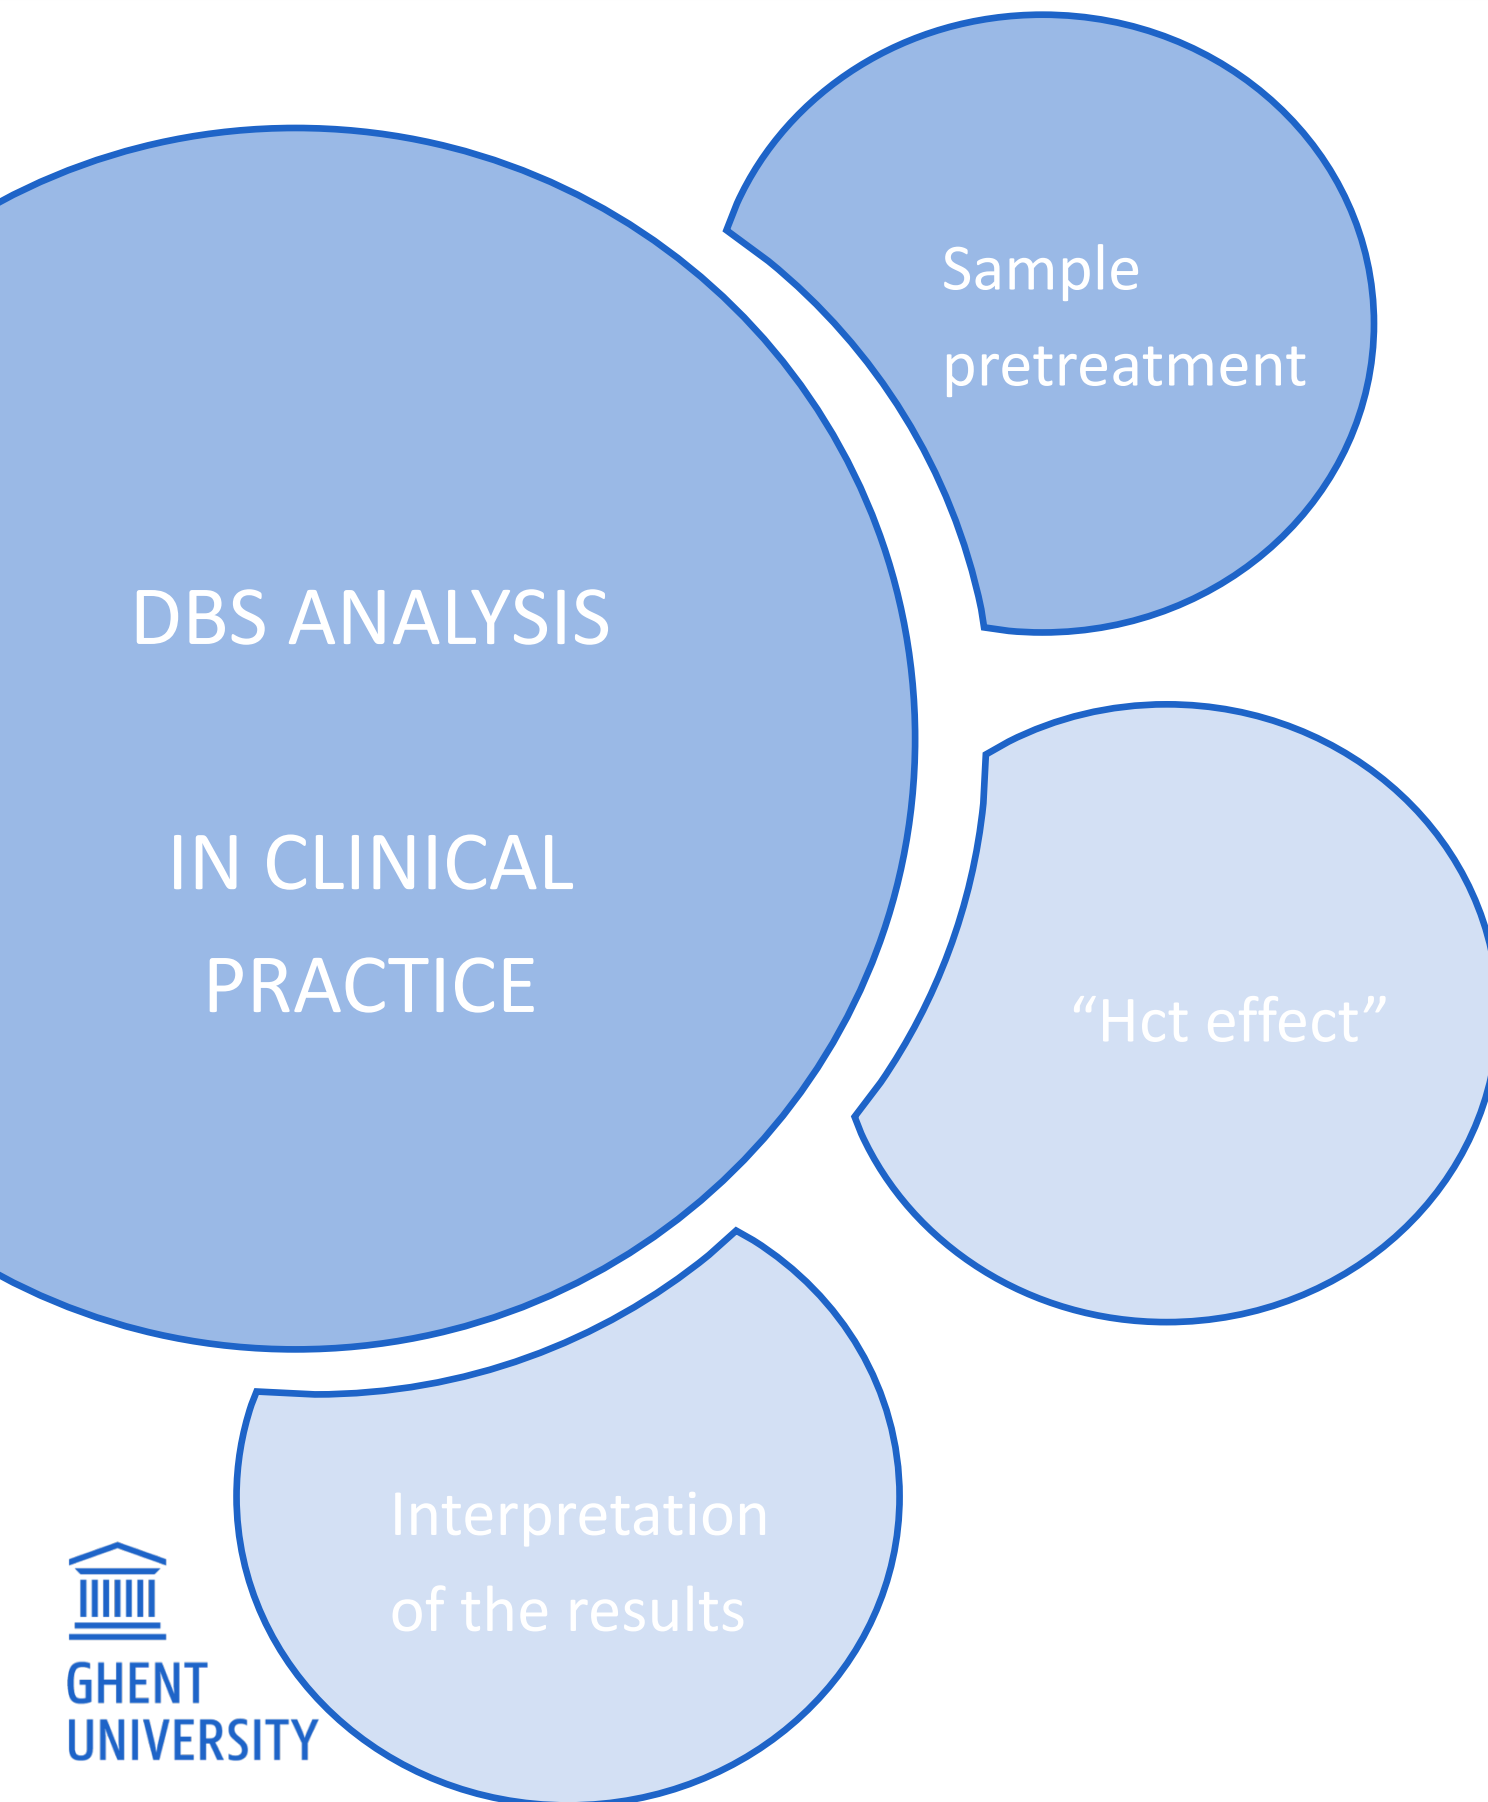

PRESENTATION OUTLINE

- Current status:
 - Dried blood spots and the hematocrit effect
 - Hematocrit prediction of dried blood spots
- Near-infrared based hematocrit prediction of DBS: an in-depth evaluation
 - Extensive evaluation of a commercially available NIR set-up:
 - Performance of the calibration model
 - Method validation and stability
 - Robustness
 - Method comparison and application
- Future outlook: where are we heading?

FUTURE OUTLOOK: WHERE ARE WE HEADING?

FUTURE OUTLOOK: WHERE ARE WE HEADING?

Labor intensive
Risk of human error

Availability of automated
extraction units

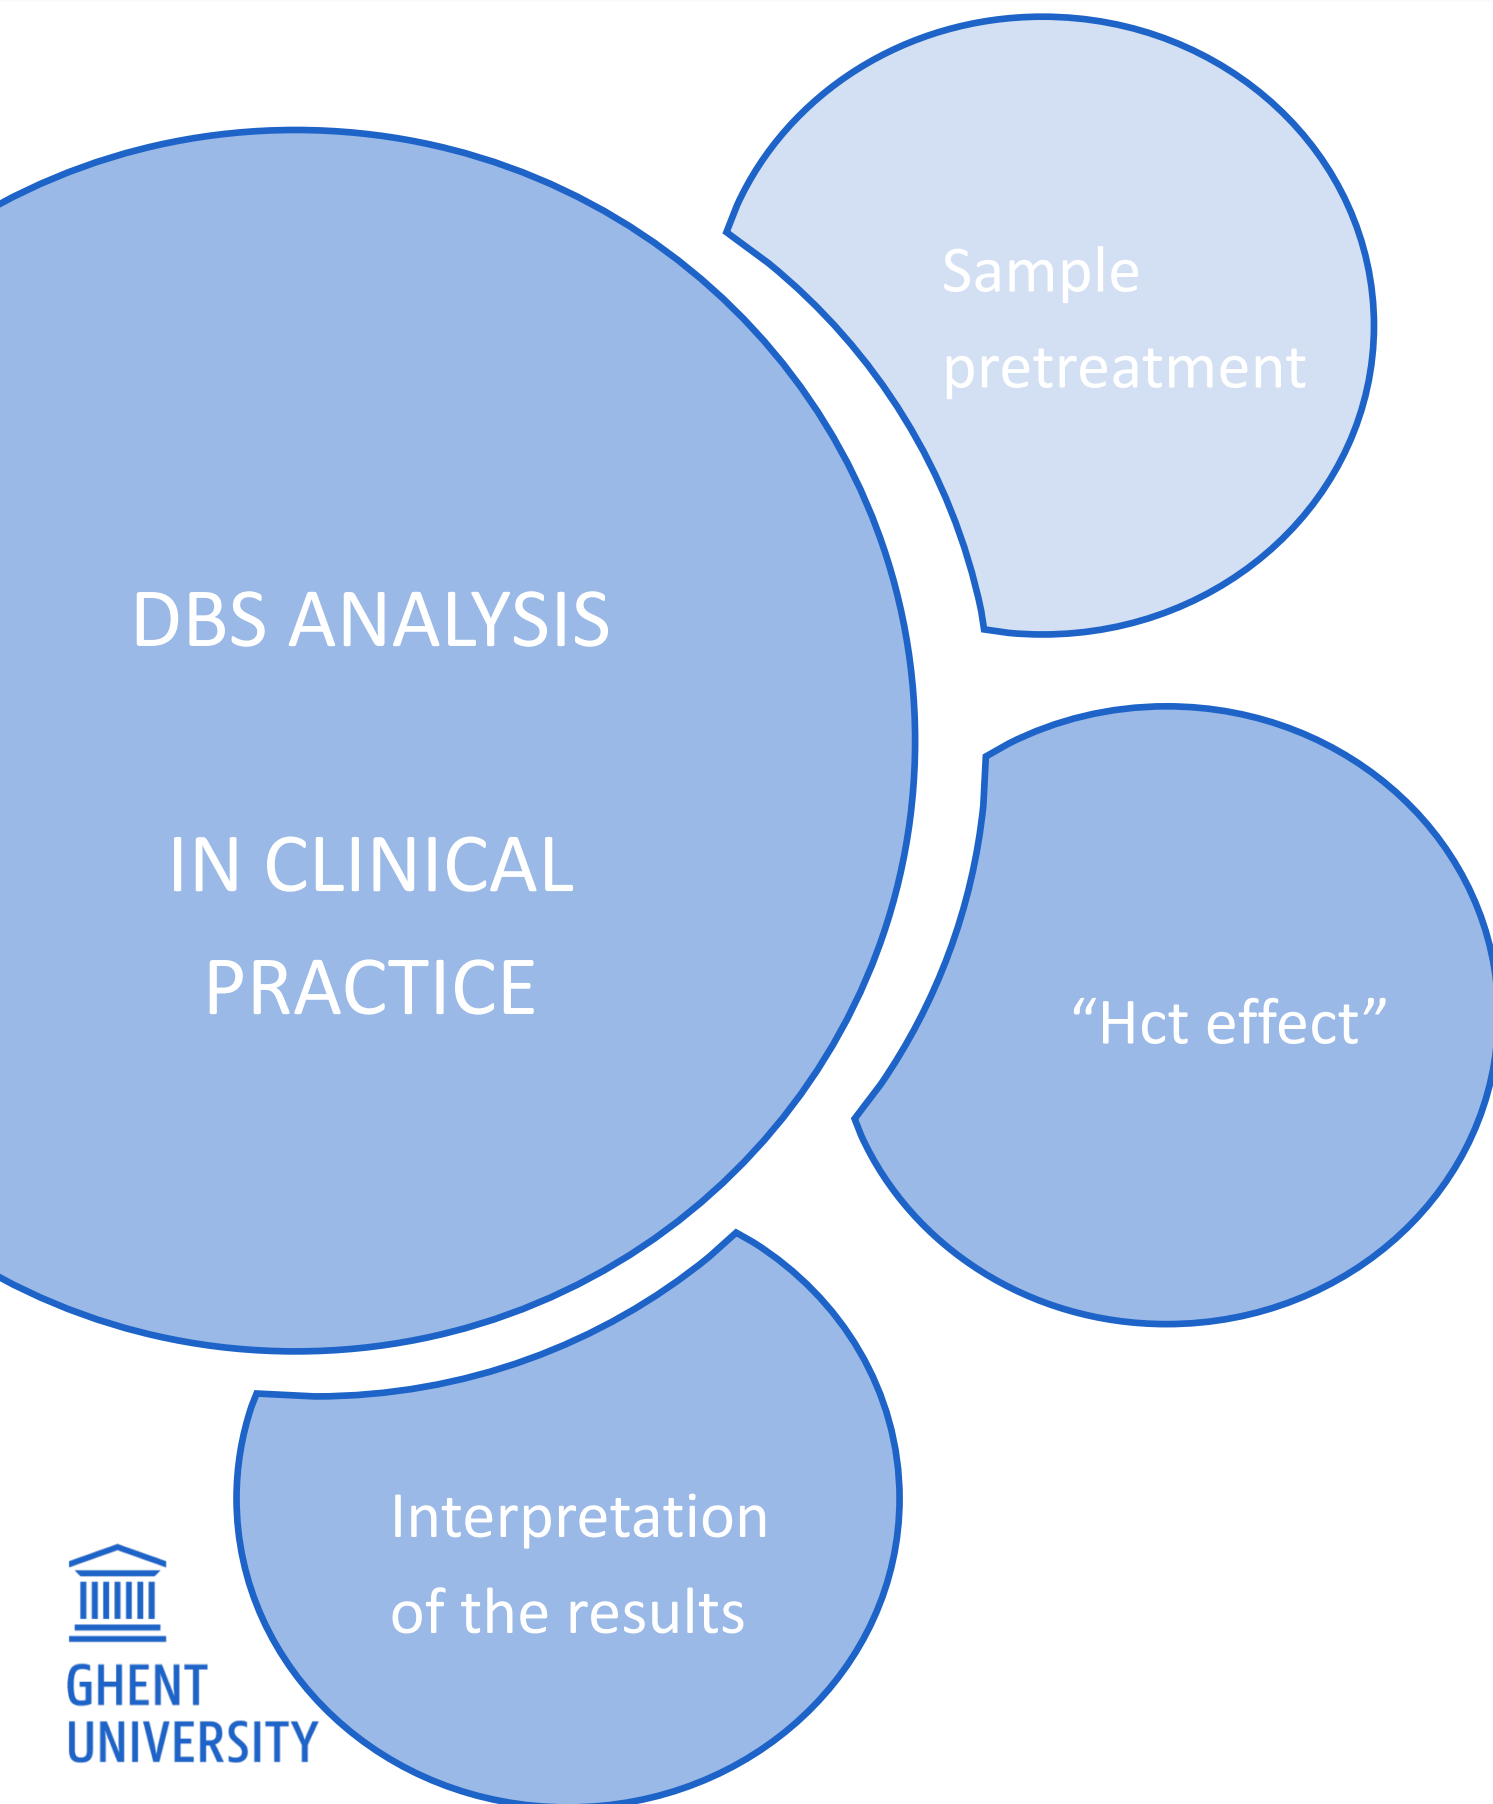

**DBS-MS 500,
CAMAG**

**DBS Autosampler, Spark
Holland**

FUTURE OUTLOOK: WHERE ARE WE HEADING?

The predicted Hct (either determined via destructive or non-destructive methods) allows:

- To compensate for the Hct effect via dedicated algorithms
- To verify whether the Hct of a DBS sample is within a validated range
- To calculate plasma or serum concentrations based on DBS results

All tools are available for a successful implementation of DBS-based methods in clinical practice.
