Cell Penetrant Peptide Provides a flexible solution to Deliver Frataxin (FXN) to Patients with Friedreich's Ataxia

- **Friedreich's ataxia (FA):**
- Is a rare, progressive, multi-symptom neurodegenerative genetic disease and simultaneous cardiac dysfunction
- Results from a reduced expression of the mitochondrial protein, frataxin (FXN), a major contributor to mitochondria functioning
- Is a debilitating disease that presents in mid-childhood and affects the functioning of multiple organs and systems
- Has no medical treatment options approved for patients with FA, to date
- Larimar is developing a Cell Penetrant Peptide-based therapy to deliver FXN
- **High variability in patients FXN reduction levels results in non-uniform clinical presentation and progression**
- **Biomarker approach is needed and actively sought-after to objectively assess interventional benefits**
- **There is no approved validated biomarker**

CTI-1601 Effectively Delivers Mature and Functional Frataxin to Cells and Organs in KO mice

Administration of CTI-1601 to mice

Administration of CTI-1601 to Mice Effectively Delivers Human FXN to Cardiac Mitochondria

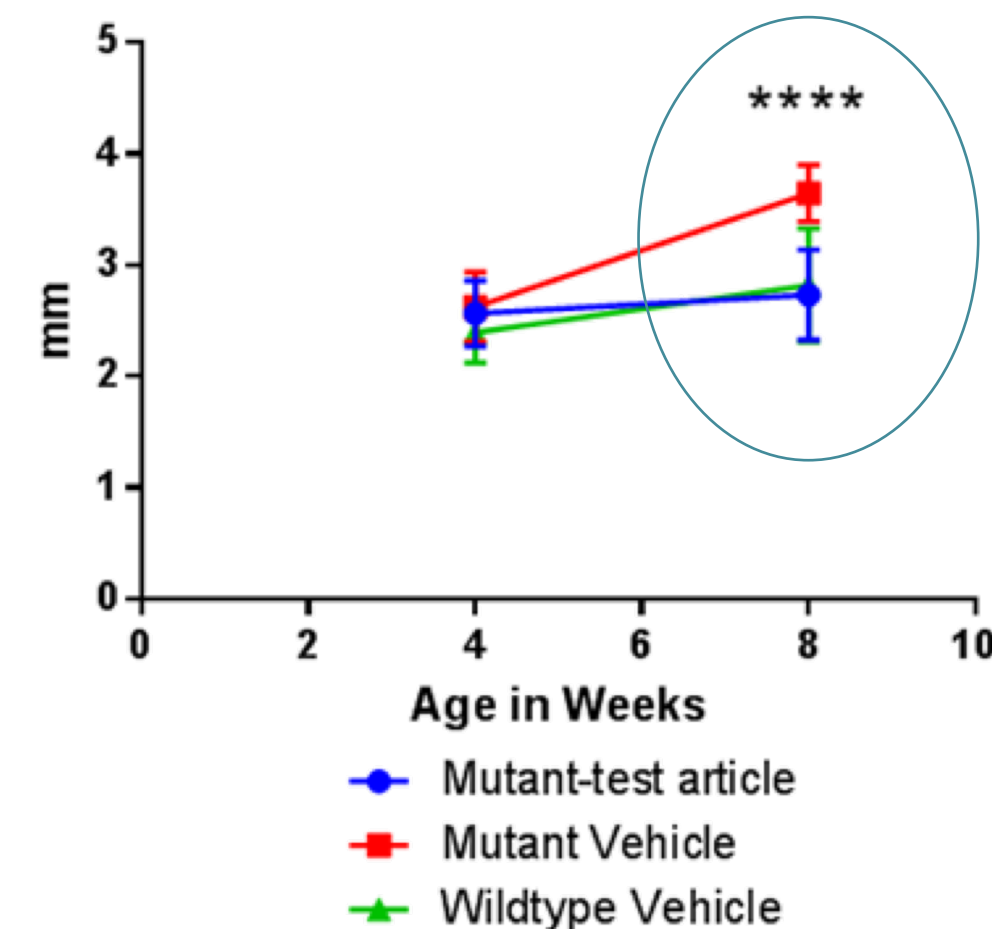

Administration of CTI-1601 to Mice Restores Mitochondrial Muscle SDH Activity in KO Mice

Gene Expression-Based Biomarker Strategy

Defining Frataxin Sensitive Gene Markers- FSGMs

- Tissue selection
- Trans-sectional and longitudinal variability

FXN-Sensitive Gene Markers are Inversely Regulated by lack of FXN and Treatment with CTI-1601

FXN-Sensitive Gene Expression in Patient-Derived Fibroblasts

Over 150 genes that are sensitive to cellular levels FXN were identified that could serve as biomarkers

Expression levels and sensitivity to FXN of FSGMs in human tissue is unknown

Limited amount of RNA in patient specimen could limit the use of FSGMs as biomarker approach

- Assessing expression levels of 150 genes by qRT-PCR would require 11ug RNA
- Yield from buccal swab 300ng-1.8ug

Use of Nanostring Technology as an alternative to qRT-PCR

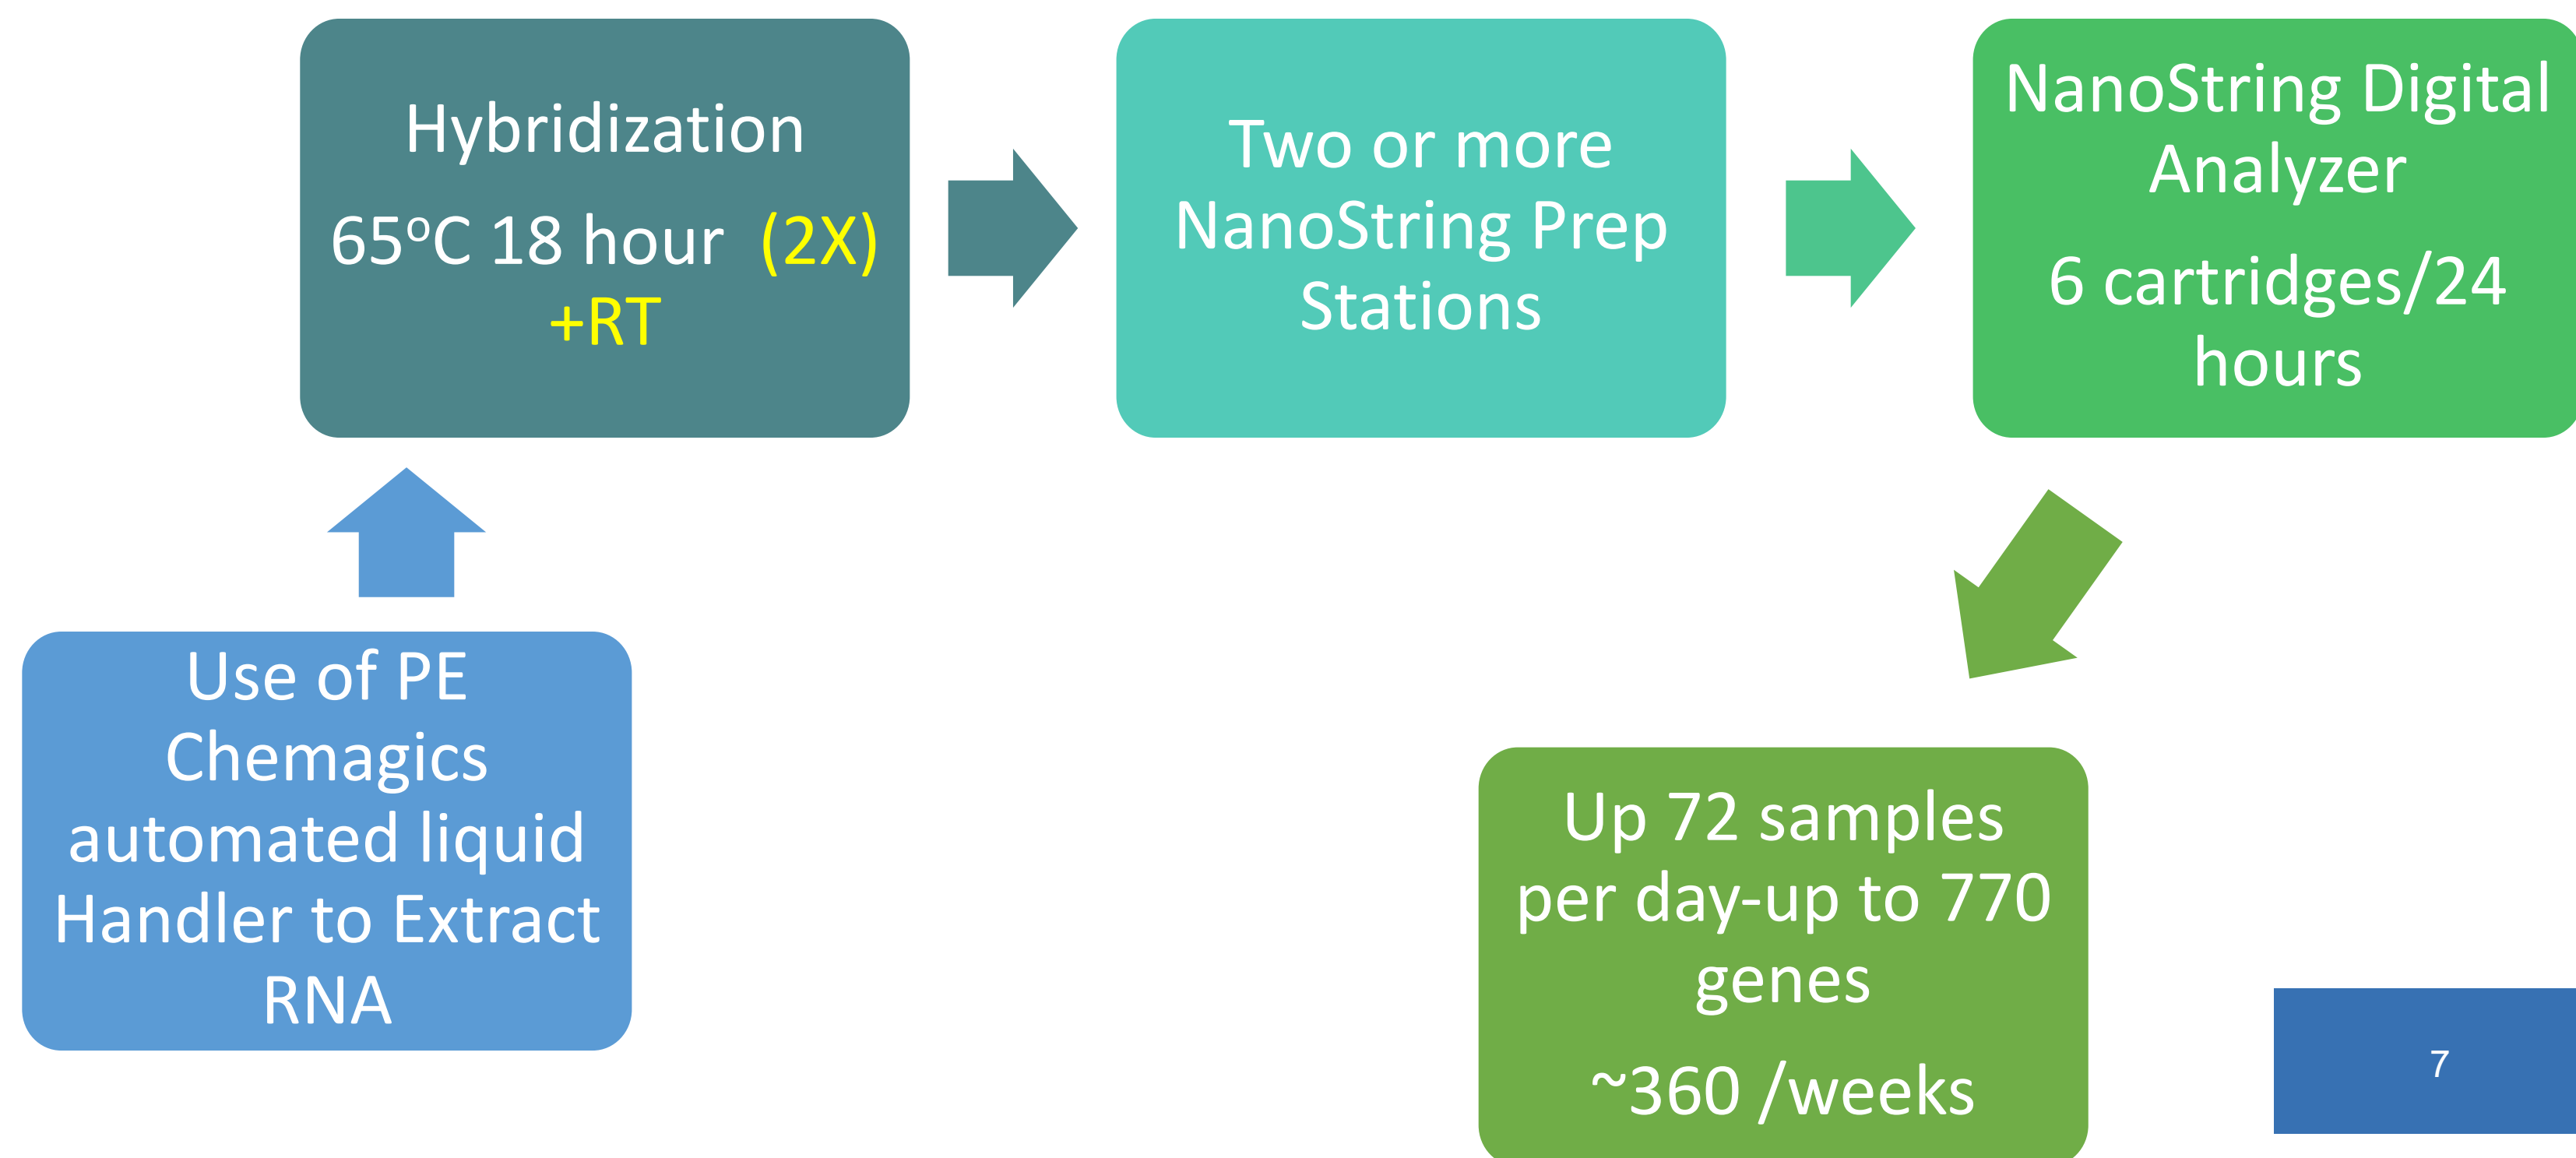

- Comparability to qRT-PCR
- Explore adequacy in the absence of clear regulatory guidance around the use of gene expression biomarkers
- Sensitivity to Codeset (Target gene + house-keeping gene) composition
- Intra- and inter- sample variability
- Effect of RNA quality
- Linearity
- Workflow to minimize variability
- P&A and reproducibility on clinical samples
- Feasibility in clinical setting

Effect of Codeset Composition on Gene Expression Quantitation and Normalization

Specimen Collection and Handling

PAXgene Blood RNA Tubes

- **Collection device**
 - Blood Cells collected in PAXgene RNA tubes – 762165 PreAnalytix Qiagen
 - Exact volume essential
 - Buccal Cells collected in ZymoResearch Buccal Swab Collection kits – R1107-E ZymoResearch
 - Mouth rinse, 4 minutes swabbing performed by operator
- **Storage**
 - Whole blood samples (when frozen/stored correctly)
 - 11+ years (long term storage) = -80°C
 - 3 days = Room temperature (~20°C)
 - Buccal cell samples
 - Indefinitely = -20°C to -80°C
 - >1 month = Room temperature (~20°C)
- **RNA isolation**
 - Chemagic RNA Blood 2.4K Kit H24 = CMG-1084 is used to extract RNA from 2 whole blood replicate tubes per sample and up to 2 buccal swab replicates per sample for a maximum of 24 samples per day.
- **RNA Quantification and QC**
 - Duplicate nanodrop quantification
 - average concentration [ng/uL]
 - average A260/A280 ratio.
 - RNA concentration above 50ng/ul is the sole influencing factor

Healthy Volunteer Baseline
vs
FA Baseline

Conclusions

- Gene expression analysis can be a viable option for biomarker strategy in rare and orphan diseases associated with proteins that have no clear biological function
- Codeset approach constitutes a good alternative to genome wide analysis provided the target gene selection process is thorough, including determining robustness of gene expression in accessible tissue(s).
- Workflow is simple and can be performed with 1.5 FTE
- Data show tissue- and gene-specific variability of expression
- Data suggest that technology is robust enough and that its associated bioinformatics can discriminate between clinical populations
- Our data suggest that tissue gene expression analysis for biomarker discovery and evaluation in clinical context is achievable
- Regulatory guidance is scarce

Thank you
