EBF Focus Workshop\_9thJune 2023

# Outline

## 1 Introduction

- Therapeutic oligonucleotide (OGN) landscape and available Bioanalytical platforms
- LC-MS/MS workflow for analysis of OGN

## 2 Bioanalytical challenges in OGN analysis

- Case study 1: Purity/interference/cross talk evaluation
- Case study 2: Matrix effect and choice of Internal standard
- Case study 3: Carryover mitigation strategy and system reproducibility

## 3 Extraction of OGN from biological samples using LNA Probes + LC-MS/MS analysis

## 4 Recommendation and conclusion

# Therapeutic OGN landscape and available Bioanalytical platforms

- **ASOs** (ssDNA/RNA, **14-25 nt**)
  - Structural design/modifications: gapmers, PMO, PS, 2' MOE,...
  - Approved drugs: fomivirsen, nusinersen, .....
- **siRNAs** (dsRNA **2x 20-25 nt**)
  - antisense strand (AS) or guide strand
  - sense strand (SS) or passenger strand
  - Structural modifications: PS, 2'F/OMe, conjugation,...
  - Approved drugs: patisiran (2018), givosiran (2020), inclisiran (2021),....
- **Other oligo modalities:** example mRNA therapeutics

# Bioanalytical Platforms for OGN quantification

# LC-MS/MS workflow for the analysis of OGNs

Skin cells at 20x magnification

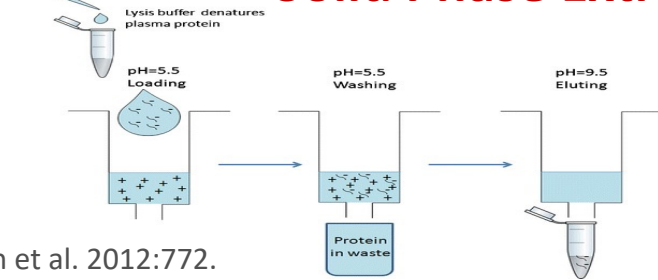

# LC-MS Assay for Oligonucleotide Therapeutics

## Sample Extraction

### Liquid-Liquid Extraction

### Solid Phase Extraction

Chen et al. 2012:772.

### Hybridization

Li et al, Anal Chem. 2020: 10548

## LC Separation

### Ion-pair Reverse Phase LC

#### Alkyl amine

Triethylamine  
Boiling point: 89°C

Diisopropylethylamine  
Boiling point: 127°C

Dimethylbutylamine  
Boiling point: 127°C

#### Fluoroalcohol

HFIP (Hexafluoroisopropanol)  
Boiling point: 58.2°C

#### Oligonucleotide

### Hydrophilic Interaction Chromatography (HILIC)

## Mass Spec Detection

### LC-MS/MS (MRM)

### LC-MS (HRMS)

- Sum of the isotope/charge state ions improves sensitivity
- Fragmentation independent
- Improves selectivity
- Metabolite ID
- Trouble shooting

# siRNA IP-RP chromatography

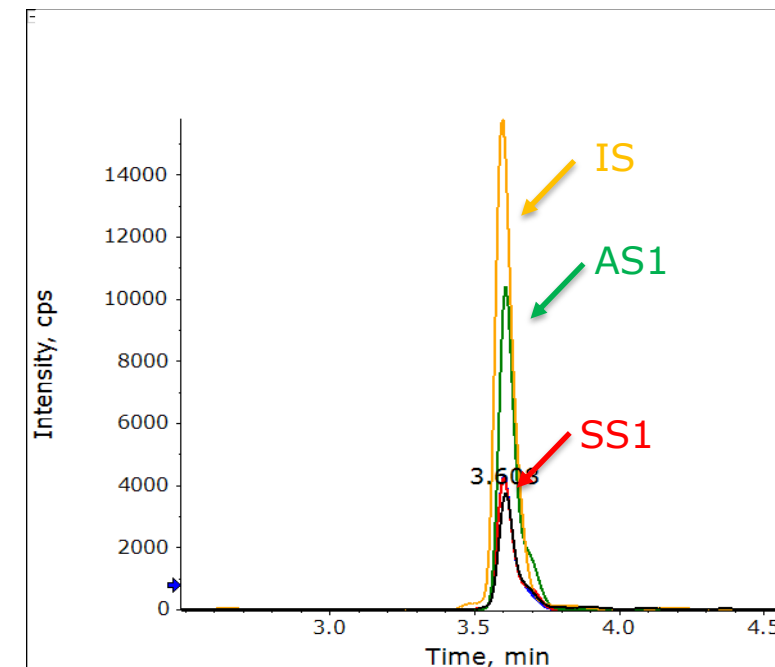

| LC parameter   | Shimadzu LC 20AD                        |

| AS1 | 685.8 (10-) > 334; 762.1 (9-) > 604 |
| IS  | 634.1 (8-) > 617.1                  |

IS = internal standard  
 AS1: antisense strand 1  
 SS1: sense strand 1

# IP-RP chromatography with an siRNA

➤ Only the **antisense strand is quantified**, and concentration (ng/ml or ng/g) reported as **duplex equivalent**

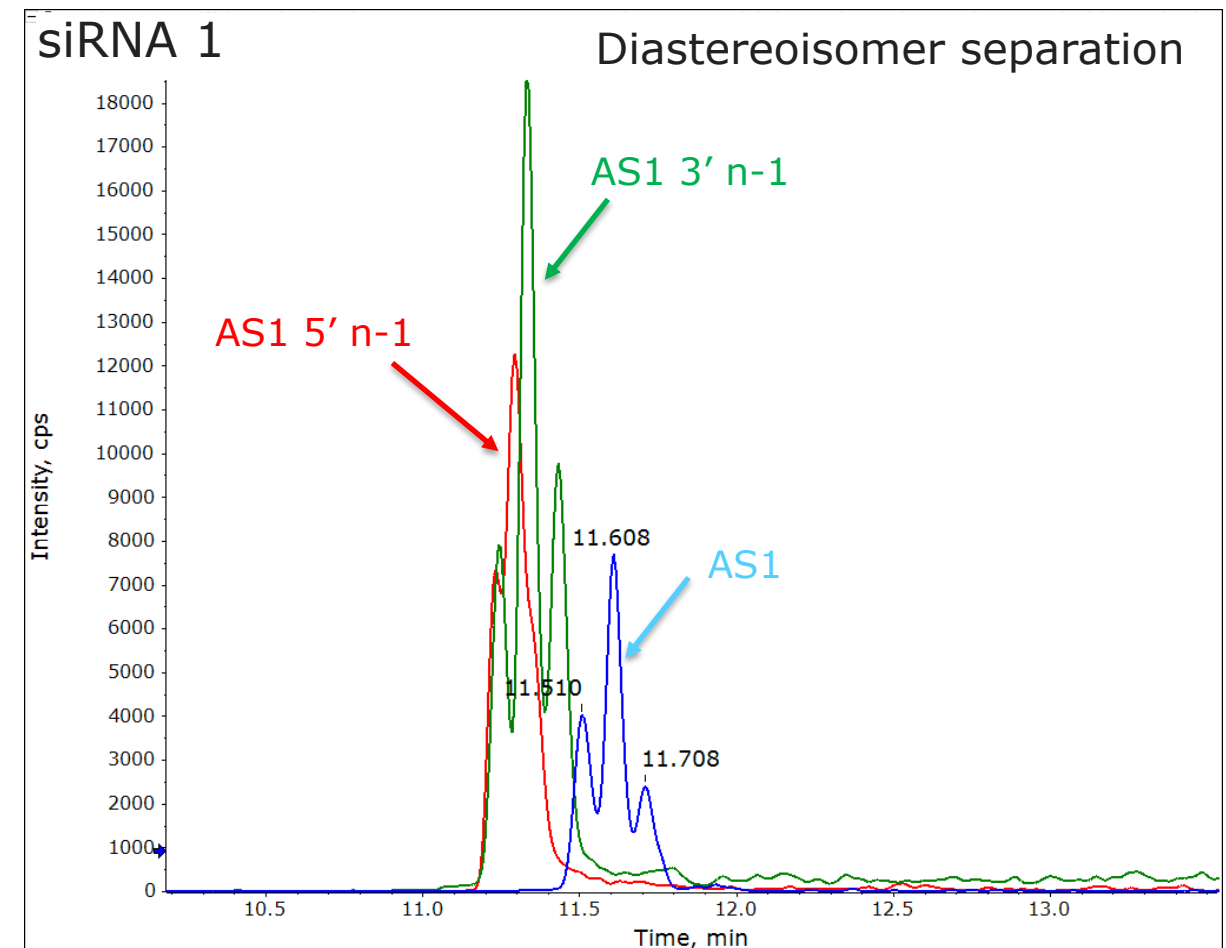

# LCMS separation of truncated metabolites of siRNAs

- Adapting chromatography: slow gradient 1-15% B over 20 min

- Both siRNA have same number of phosphorothioate (OPS) linkages

- Diastereomeric selectivity: C>G>A>T

# Bioanalytical challenges in OGN analysis

## Case study 1:

## Purity/interference/cross talk evaluation

Skin cells at 20x magnification

# Rationale for purity/interference evaluation

- **A MUST for MS/MS analysis with co-elution of multiple OGN species (drug + metabolites)** and impurity is expected
- OGNs show multiple charge states with Na/K adducts,
  - Similar m/z values can be expected

m/z of -11 is **697.0** for **siRNA-1**

m/z of -10 is **697.1** for **siRNA-2**

# Rationale for purity/interference evaluation(2)

- The use of structural analogues (e.g siRNA or ASO) **as internal standard** in discovery phase projects
  - Check the contribution of the analogue **IS to the LLOQ of OGN unchanged drug**
  - Check the contribution of the OGN drug to the response of the analogue IS
- In multi-analyte analysis:
  - The possibility to combine 2 (or more) siRNA's/ASO in 1 calibration curve

## Our internal Sequence of events (Internal process)

- **On-the-column Tuning** of the different OGNs (Q1) and select the 3-4 most intense charge states in Q1;
- Via infusion, optimize the other MS/MS parameters
- Of each charge state search for the most intense product ions
- Prepare standard solutions of the same concentration
- Inject the standard solutions separately and monitor the other transitions

# Example Purity/interference check

- Acceptance criteria: % impurity should be < 2%
- Standards were injected at equimolar concentrations

|   |                | AS1           | % impurity   | AS1           | % impurity   | AS1           | % impurity  | AS1          | % impurity |
|---|----------------|---------------|--------------|---------------|--------------|---------------|-------------|--------------|------------|

➤ Based on these data, -9a charge state was selected

# Case study 2:

# Matrix effect and choice of analogue internal standard in Discovery projects

Skin cells at 20x magnification

# Performance of analogue ASO IS: incurred samples vs calibrators

- Choice is limited to analogue antisense OGN (ASO) and siRNA with 100% sequence dissimilarity compared to the analyte to be quantified
- @Janssen; historically, started with ASO 16mer OPS as IS. Used to support all projects
- We observed matrix-dependent IS response with brain and tissue homogenate. IS added prior to SPE extraction

- **Sample clean-up with Clarity OTX SPE 96 well plate**
- Incurred samples and calibrators were prepared by different labs. **Sample extraction with Clarity OTX plate was performed by 1 lab**
- Different IS response between incurred samples and calibrators prepared in RIPA buffer
- IS response in incurred samples more variable with spleen than with Brain homogenates: **extraction efficiency?**
- Note: RIPA may contain SDS which might interfere with SPE extraction. **Recommended to use 10 mM EDTA as extraction buffer**

Fig .1 incurred samples and the calibrators were prepared with **separate protocols**

# Performance of analogue lipid conjugated ASO vs siRNA

Fig .3a and b: 16MER-OPS ASO IS and siRNA IS in brain homogenates

Fig .3b

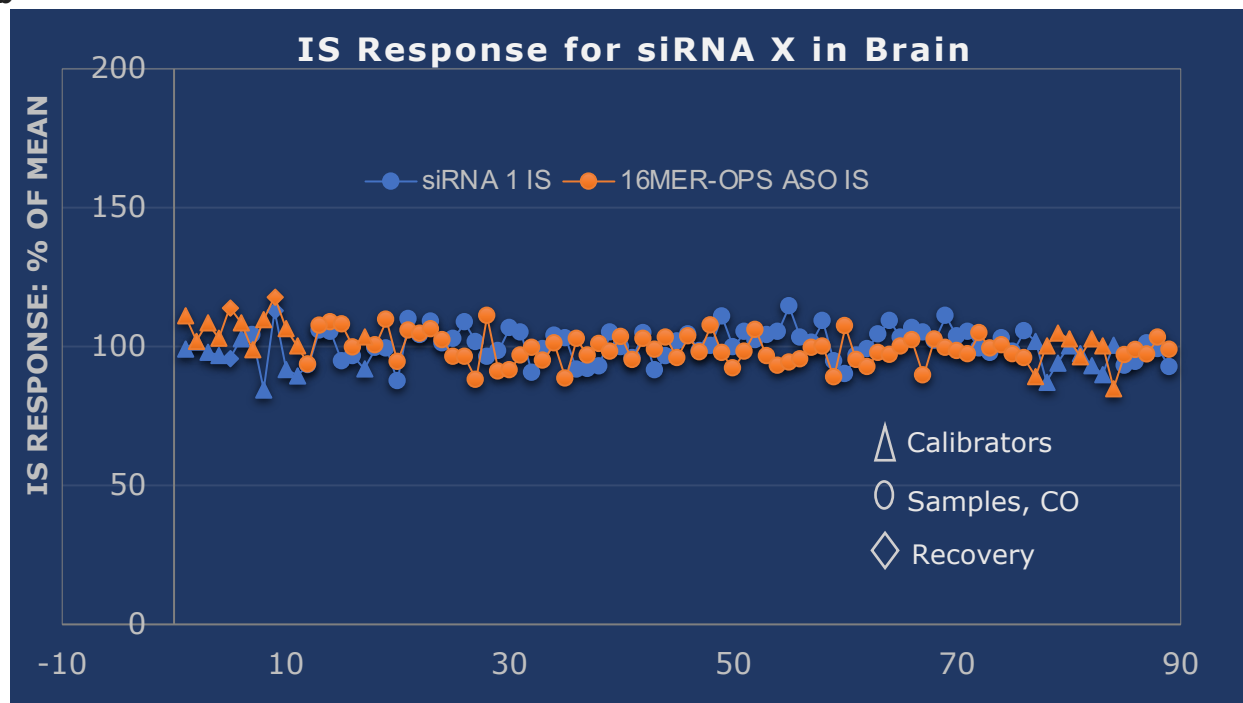

Fig .4 a and b 16MER-OPS ASO IS and siRNA IS in spleen homogenates

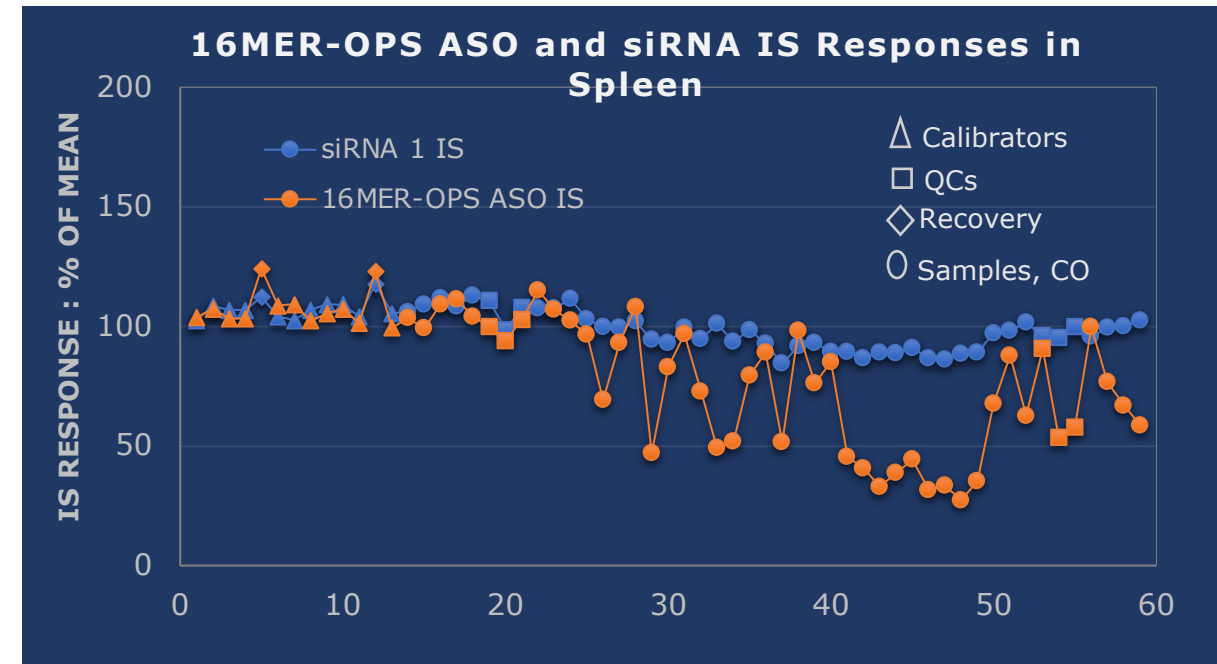

Fig .4b

# Case study 3:

# Carryover mitigation strategy and system reproducibility

Skin cells at 20x magnification

# Carryover Mitigation Strategy and System Reproducibility

Case study: Carryover observed during study sample analysis

| Sample ID | Sample type | Calculated Conc (ng/ml) | % Acc | JNJ-1 (-9g)<br>Peak Area | % CarryOver w.r.t<br>ULOQ | % CarryOver w.r.t<br>LLOQ |
|-----------|-------------|-------------------------|-------|--------------------------|---------------------------|---------------------------|
| LLOQ      | Standard    | 21.1                    | 105.5 | 9783                     |                           |                           |
| ULOQ      | Standard    | 11300                   | 113.2 | 3071974                  |                           |                           |
| CO        | Unknown     | 98                      |       | 31096                    | 1.01                      | 317.9                     |

| CO        | Unknown     | 14.4                    |       | 7086                     | 0.23                      | 72.4                      |
| CO        | Unknown     | 13.1                    |       | 6671                     | 0.22                      | 68.2                      |

➤ After days of troubleshooting (analytical column, tubing's, mobile phase) the CO issue was resolved

## 1. Carryover mitigation:

- ✓ Compound dependent but also different LC systems tend to have different CO --→ next slide
- ✓ **Use appropriate column fittings to avoid dead volumes:** pre-flushing is recommended
  - NanoViper (Thermo Scientific) (pH limited recommended not to use Infront of the column)
  - SecurityLINK (PEEK SIL) finger fitting (Phenomenex),
  - PEEK tubing. New tubing gives distorted peaks. Equilibration with sample extract is needed

# Carryover mitigation strategy and System reproducibility (2)

## 1. Carryover mitigation (continuation):

- ✓ Totally Inert UHPLC system. Is it needed for biological samples or Myth – Is stainless steel OK?
- ✓ Backflush the analytical column with Mobile phase B – prior to use
- ✓ BioInert analytical columns and frit
  - **Acquity Premier BEH C18 (Waters)**, pH 1-12
  - **YMC Triart C18, 300Å (YMC)**: pH 1-12 + temperature recommendation
  - **BioZen Oligo (Phenomenex)**, core shell technology: pH 1-9
  - DNAPac™ RP (Thermo Scientific) (Not Bio inert). Polymeric column, very stable over pH9

## 2. System reproducibility

- ✓ **Equilibrate** by injecting high calibrator standard (1/4 ULOQ) extract until a stable signal is reached. DNAPac columns may need more injections
- ✓ **Use a dedicated** LC-MS/MS system: keep it on constant low flow
- ✓ Mitigate drift in MS response by keep mobile phase(s) on ice during analytical run especially mobile phase containing HFIP and ion pairing reagent
- ✓ Use mobile phase solvent Debubbler if needed

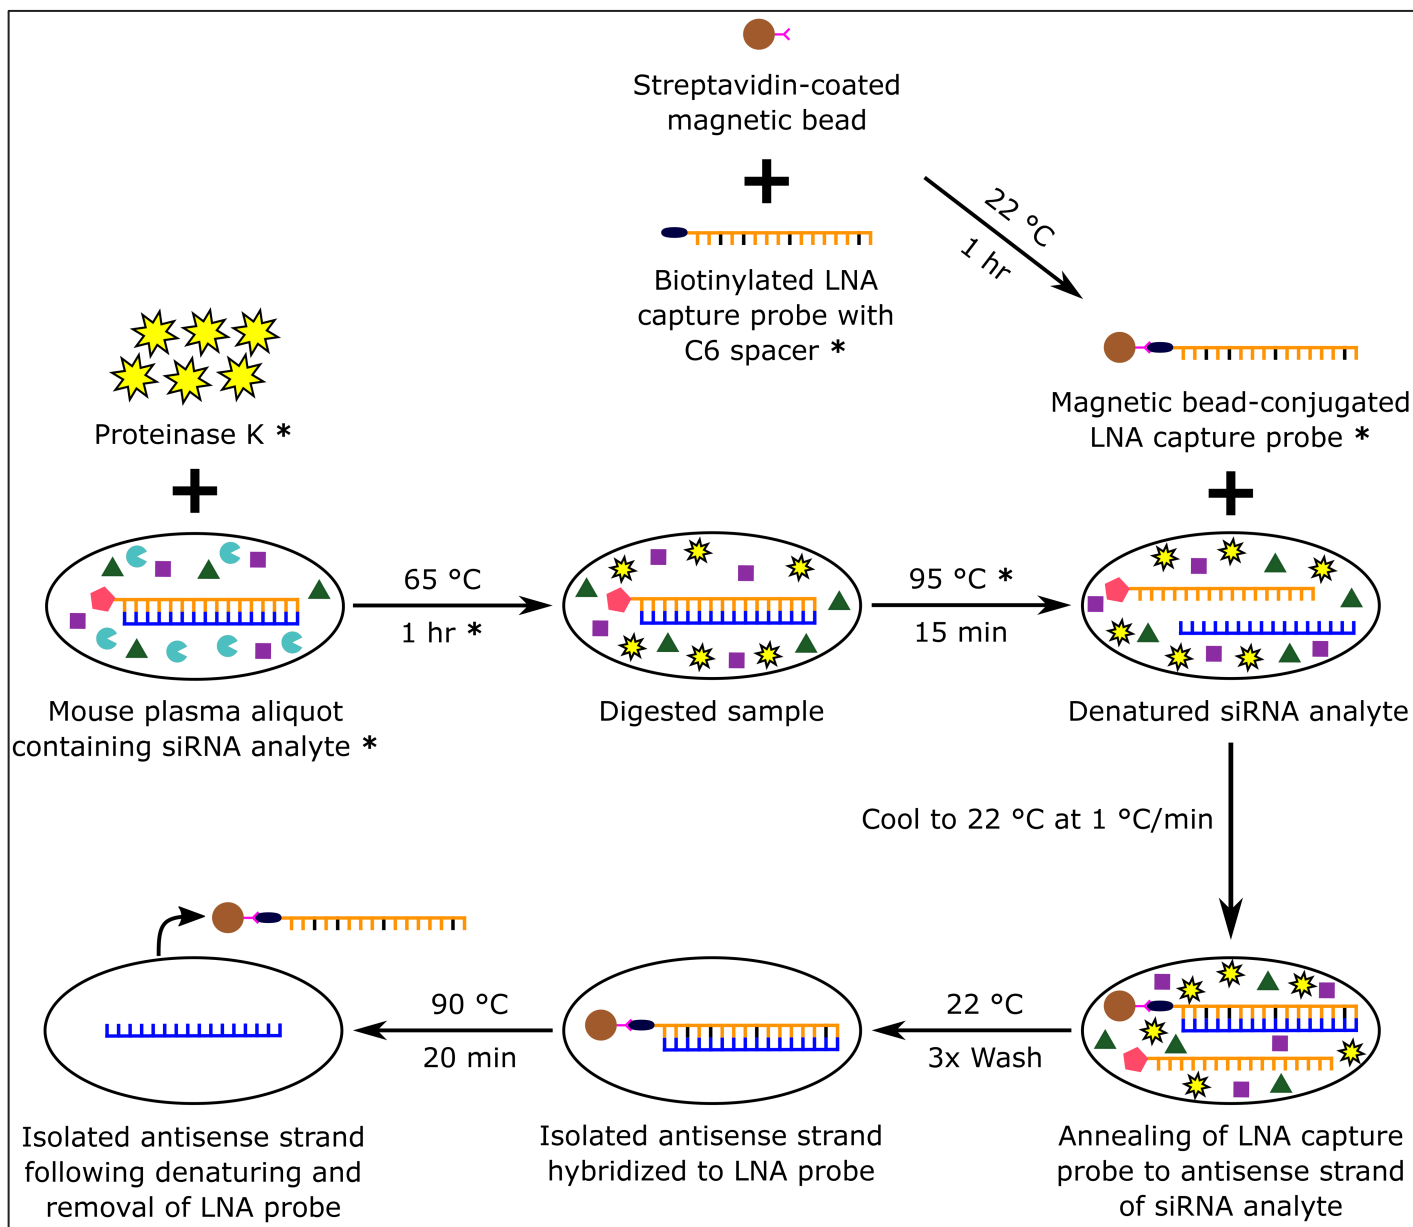

# Lessons learnt

1. Interference evaluation is critical when setting up bioanalytical methods for multiple analytes
2. RIPA as **homogenization buffer** is not our preferred choice since it often result in poor MS response due to signal suppression
3. Combination of structural analogues IS provide more flexibility to select the best IS post analysis to mitigate matrix effect. But interference check must be performed
4. Analogue siRNA performed better than an analogue ASO. Most likely related to differences in ionisation efficiency between the ASO and siRNA. **Is it sequence dependent?**
5. Other analogues with close **sequence similarity** to the target analyte(s) would be preferred (if available)
6. Carryover is analyte dependent: **phosphorothioate (OPS) modified and lipid conjugated OGN** tend to show more carryover
7. Use of Bioinert UHPLC systems and columns can help mitigate carryover of OGN
8. Minimize dead volumes created by incompatible column fittings and tubing's
9. Carryover investigation is an art and should be approached systematically

# Extraction of OGN using LNA probes

Skin cells at 20x magnification

# Hybrid siRNA LC-MS/MS Analysis Workflow

## Locked Nucleic Acid (LNA) Probe

- Ribose ring is "locked" in the ideal conformation for Watson-Crick binding
- Higher thermal stability for LNA-DNA interaction compared to DNA-DNA
- Ideally want self-hybridization score < 30
- Generally, 5-7 LNAs in the probe are sufficient

## Method Optimization Points for Hybrid ASO Analysis

- Buffer for Proteinase K digestion and amount of Proteinase K
- Duration of Proteinase K digest
- Capture Probe TEG spacer position

## Additional Challenges for siRNA

| Challenges for siRNA               | Approach                                       |
|------------------------------------|--|
| Competition from sense strand      | Probe with higher affinity                     |
| Double stands need to be separated | Heat treatment to un-anneal the double strands |
| Self-hybridization of the probes   | Optimize sample/probe ratio                    |

Agrawal et al. (2023) submitted to Bioanalysis journal

Agrawal et al. (2023) Submitted for publication. Sips et al, Bioanalysis 2019 ; Li et al, Anal Chem 2020

# Optimization of Probe Amount and Sample Volume

# Capture Probes can cause Interference Peaks for Analytes

- LNA probe that was direct complement to SIR-2 antisense strand with C6 spacer had interference peak for all MS/MS transitions evaluated
  - Peak resolvable from analyte peak by changing LC gradient, but concerns of inter-column variability in retention time
- Addition of mass to probe using TEG spacer (C15 v/s C6) caused a different interference peak to be observed
- Adding an additional nucleotide to the 3' end and using C6 spacer shifted probe mass sufficiently to eliminate interference peak
- Adding an additional nucleotide to the 3' end and using TEG spacer did not aid with removing the interference peak
- Interference peak not exactly the same Q1 mass as antisense strand (0.2 – 0.7 Da difference based on HRMS analysis)
  - Mass shift is easily resolved on HRMS system
  - Mass shift cannot be resolved on MS/MS system

# Conclusions: Use of LNA probes for sample extraction

1. First known assay for analyzing siRNA analytes using LNA probes for sample extraction/clean-up
2. The assay is a specific and sensitive hybrid LC-MS siRNA assay which uses less sample volume, making it highly suitable in preclinical analysis
3. LLOQ and linear range in mouse plasma were:
  - siRNA-1 from 25.0 – 10000 ng/mL using a 25  $\mu$ L aliquot
  - siRNA-2 from 0.500 – 500 ng/mL using a 10  $\mu$ L aliquot
