Protein LC-MS

Goal: Streamline Protein LC-MS Sample Preparation

Bottom-up Sample Preparation Workflow

2-step

Reduction/alkylation

Reduction/alkylation

Digestion

1-step

Reduction/alkylation/digestion

- Model analyte: IgG1 mAb – 4 HC surrogate peptides monitored
- Matrix: rat plasma
- LC-MS: Acquity UPLC and Xevo TSQ (Waters)

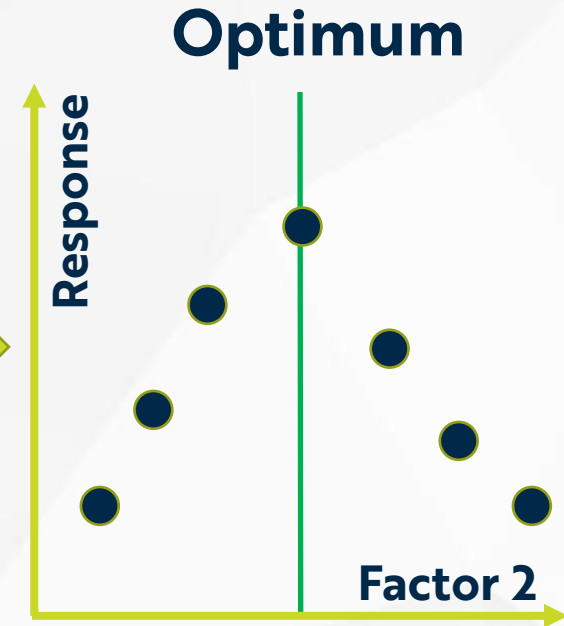

-DTLMISR-
-TPEVTCVVVDVSHEDPEVK-
-FNWYVDGVEVHNAK-
-VVSVLTVLHQDWLNGK-

Design of Experiments (DoE)

Changing a single factor at a time

Fix factor 1

- Does not always lead to real optimum
- Limited information
- Many experiments

Design of Experiments (DoE)

Conventional

VS

DoE

- A strategically planned and executed series of experiments
- All factors (e.g. pH, solvent, temperature) are changed simultaneously
- Allows to investigate multiple factors at the same time
- More information, model setup and predictive power
- Fewer experiments

Screening DoE – 2-step prep.

Objective: find the important factors

Variables

- Reduction reagent: ~~DTT~~, TCEP, THPP
- Alkylation reagent: IAA, CAA
- Reduction reagent concentration: 1-50 mM
- Alkylation reagent concentration: 2-100 mM
- Incubation temperature: 22-94°C
- Red/alk incubation time: 10-30 min
- Digestion incubation time: 1-3 hours

974 samples **DoE: 19 samples**

Screening DoE Results

Coefficient plot for VSV surrogate peptide

Factors to improve peptide abundance

- TCEP
- CAA
- High alkylation reagent concentration
- Combination of TCEP + CAA

No impact

- Incubation time and temperature

Conclusions

- Use TCEP and CAA
- Alkylation reagent concentration > reduction reagent concentration

DoE Optimisation

Objective: optimise important factors

Variables

- Reduction reagent concentration: 1-50 mM
- Incubation temperature: 22-94°C
- Red/alk incubation time: 10-30 min
- Digestion incubation time: 1-3 hours

83 samples

DoE: 27 samples

DoE Optimisation Results

LC-MS data

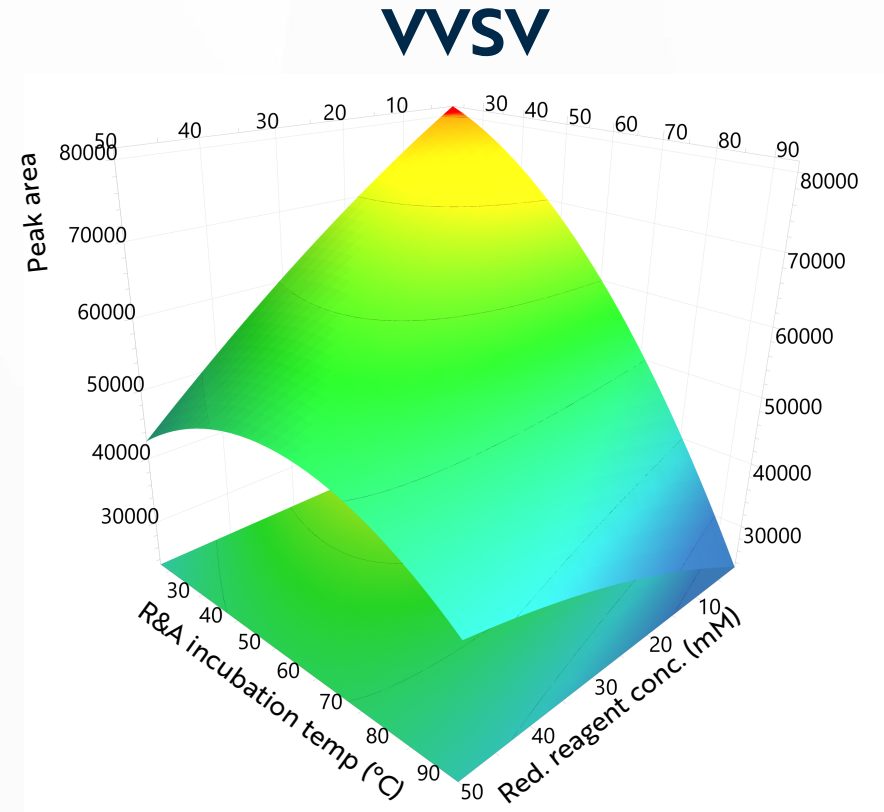

Model fitted for each peptide

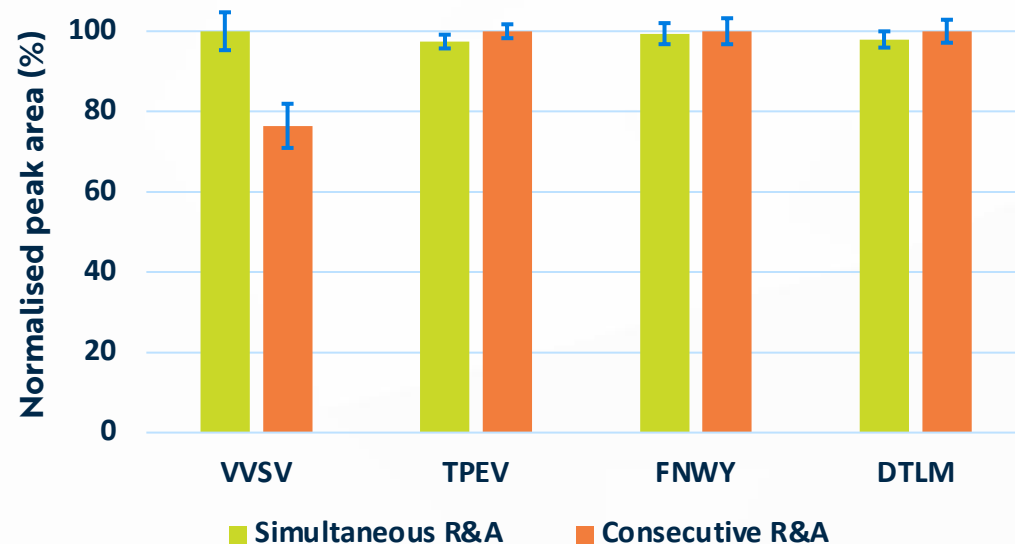

Optimal simultaneous R&A:

- 6.6 mM TCEP
- 19.8 mM CAA
- R&A incubation at 48°C for 30 min
- 1.5-hours trypsin digestion

DoE Optimisation Results

Simultaneous R&A **vs** sequential R&A

Conclusions

- Simultaneous R&A yields high and consistent peptide responses
- 30-60-min shorter preparation time
- combination with rapid digestion > single day preparation

Challenge

DoE screening **only 19** samples, but...

Automation

Formulatrix Mantis liquid dispenser

- **Objective:** compare automation vs manual

1-step DoE optimisation

- Reduction reagent concentration: 0.1-4 mM
- Incubation time: 1-3 hours
- E/P ratio: 1:25-1:100

DoE

- **17** samples

Automated vs Manual DoE

Predicted optimal conditions

	Reduction reagent c (mM)	Incubation t (min)	E/P
	Auto./manual	Auto./manual	Auto./manual
VVSV	0.1/0.1	30/30	1:25/1:25
DTLM	2.0/0.1	105/180 ^a	1:63/1:25
TPEV	3.6/3.9	165/145	1:33/1:25
FNWY	0.5/0.1	45/180 ^a	1:33/1:25

^a Incubation time has no significant impact

- Same predicted conditions for the most abundant peptide
- Differences > may be experimental artifact > automation: fixed conc. and different volume; manual: different conc. and fixed volume > under investigation

Summary

Process improvement

- DoE > comprehensive optimisation in 2 experiments > only ~50 vs ~1000 samples
- Unexpected interaction > combination of TCEP and CAA
- 2-step (R&A) – time saving and simplified process > to be implemented

Automation - Mantis

- Automated vs manual comparable results
 - Small footprint, compact design
 - Can hold reagents in a pipette tip
 - Very low dead volumes
 - Easy, user-friendly programming
- } useful when reagent is limited
